Walt invited me to join the group last week. Name here is Gene, WB9UOK. Been a ham since 1962 on and off. Last time I have been licensed continueously since 1976. Extra class since 1984. Have owned 520s, 820s and 830s thru the years. Last HF Kenwood rig was a 940s which I didn't like very much. Still have a place in my heart for my old 820 that I had great success with.

Hello Gene,

Welcome to the forum, glad to have you aboard. If you have any
questions please feel free to ask them, we're all here to help.

You might have a look around the files section as this area contains
a number of good articles and fixes along with manuals etc., that
may, now or in the future, help you with problems you may encounter.

Again, welcome to the forum Gene.

Mike W5RKL

ok, mike

pin 1 of the 5v avr unit (4.78 volts) (yes)

>The Counter Unit also requires 14VDC on pin 4 of the bottom edge connector
>on the bottom of the
> Counter Unit.

got to pin 4 this has 12.7 volts
is this voltage nominal,, or does it have to be brought up higher

21918. Re: incorrect displayed frequency

From: w5rkl
Topic: 21902 Message: 21918

To remove the counter unit, perform the following steps with the
820 powered OFF and power cable removed from the wall outlet.

The Counter Unit is located on the top left Netween the VFO
and the IF Unit board. The IF Unit board is mounted along the
left side of the 820. Make sure when performing step 4 you do not
remove any of the IF Unit plugs.

1. Remove top and bottom covers

2. Remove the multi-pin plug from the top of the Counter Unit. This
plug terminates at the digital display tube mounted behind the
front panel. You do NOT have to remove the digital display tube,
simply move the plug aside so it does not interfere with removing
the Counter Unit. Remove the 5V-AVR Unit plug which is directly
behind the Counter Unit assembly. Do this only to keep from breaking
or bending any of the pins while remove the Counter Unit assembly.

3. Turn the 820 upside down, front panel facing you.

4. The Counter Unit plug will be on the right, remove it by gently
pulling it off.

5. Turn the 820 right side up, front panel facing you.

6. Loosen the Counter Assembly mounting screws at the edge of the
Counter Unit and gently lift the Counter Unit from the 820 chassis.

The voltage measured at pin 4 of the 5V-AVR Unit is the loaded
voltage based on the 7805 regulator.

The 14 volt source is located on the Rectifier Unit but the filter
capacitors for that supply are located on the Relay Unit, 2 x 2200ufd
25VDC radial lead capacitors.

That's true, but if the TX is down on power it may be symptomatic of other problems. In particular there are a couple of high-value resistors that go even higher and cause mayhem with the screen grid supply.

> Aren't you limited to 50W on your call anyway?

On *my* callsign yes, not on the club callsign. The two stations were operating under GM4AGG for the main station and GM7WOS for "my" station. When I'm using it at the house I just turn the wick down a bit.

> Cheers
> Dave f4eyk

That callsign looks familiar - did I talk to you over the weekend? I haven't got the logs here ;-)

Hey Mike, I fixed it..

removed the "counter unit" completely and disassembled both halfs. clean
the contacts with a pencil eraser, scraped the contacts while re sandwiching
the 2 boards, and reinstalled the assembly.

powering up and there she be 14080 as it should be and working on all bands
now too....

thanks for the push....

You're welcome Dave and congratulations on fixing the radio.

The PLL and CAR UNIT assemblies have the same assembly, 2 PC boards
sandwiched together with fixed pins inside the metal enclosure.
Those pins, over time, can become dirty and corroded. This affects
the radio quite a bit if they do become dirty and corroded.

The ground/mounting screws on the PC boards should also be checked
to ensure they have not worked loose over time, heat, and vibration.

A lot of problems can also be caused by loose ground mounting
screws.

Again, congratulations on a job well done.

Mike W5RKL

Hi Jim,
this is where logical fault finding comes in useful - the intuitive "flash of genius" method works only often enough for us to keep trying it hi hi, so grab yourself a piece of A4 paper, and start making some notes.

You have defined the problem as low output/no ALC on 10m. Does it go OK on ALL other bands - have you checked them all, made a chart?
You mention its on 28.375Mhz - whats it like across the band, try at bottom edge and top edge. Does it receive OK on 10M, or is that bad as well?

If its OK on all other bands, then its not the bandswitch(s) - except if the PA tank circuit has fried that particular circuit. A visual inspection will reveal this. If its arcing, you will hear/smell it, and output level will vary. While your at it, wriggle the switch while on TX, see if theres any variation in output. Dirty contacts are USUALLY intermittent, show up as erratic performance on TX and RX. Given the age of the radio, cleaning the switch contacts is regarded as "routine maintenance" and should be done on any "new" radio that comes into the shack.

My own "flash of genius" suggestion is to check around the driver stage - the bandswitch section in particular. Possibly too it is out of alignment on TX - the compulsion to twiddle coils/trimmers is irresistible to some people.

If you have a CRO, look at the drive levels to the 6146's. If you don't, now is the time to research RF probes - any ARRL handbook will give you the theory. BTW - good quality used test equipment is now ridiculously cheap, a decent 20Mhz CRO should be obtainable for under the 200db range. (Modern gear is so reliable, its easier to swap it out than maintain skilled techs and expensive gear to fix things....)

Hope this helps, it is a bit of a rant I admit.

73 de VK3BFA Andrew.

Hello Klas,

When pressing on the CW key do you hear the CW sidetone? If not
then there are a couple of possibly problems.

1. Dirty switch contacts on the MODE switch

2. Dirty CW socket on the rear of the 510

3. CW sidetone oscillator is not working.

The CW sidetone is fed to the relay amplifier to place the 510 in
transmit while in CW mode. If the sidetone is not working there will
be no sidetone audio fed to the relay amplifier to activate the
relay in CW mode.

The CW sidetone is activated by the CW key being closed and a dirty
CW key socket on the rear of the 510 will also cause this problem.

Use contact cleaner to clean all of the MODE switch wafers.

Also use contact cleaner to clean the CW key socket on the rear of
the 510.

You can test how dirty the CW socket is by plugging a CW key into
the rear CW socket then press and hold the CW key closed in CW mode.
Move the CW key plug around while in the CW socket. If the 510
keys intermittently then the CW key socket is dirty. I had this
problem with my TS-820. Pressing the CW key did not produce a
sidetone and the relays did not energize. Moving the CW key plug
around in the CW socket cause intermittent keying. Cleaning the
CW socket on the rear of the 820 fixed the problem.

Try the cleaning steps first then let us know if that fixes your
problem?

Another thing to check is the VOX GAIN control. If the VOX
gain control is not set properly and the CW sidetone is working,
there may not be sufficient audio fed from the VOX amplifier to
activate the relay amplifier. Clean and reset the VOX amplifier
gain control.

21934. TS820 Frequency Display Problem but OK after warm up

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-07-29 22:20:52 UTC
From: bndphl
Topic: 21934 Message: 21934

Hi All,

I've got the usual flickering digits problem on the frequency display. I've cleaned the connectors and replaced all electrolytic capacitors but as before, the display will work for a short time after switch-on, then flicker away to itself for about 30 minutes then, after that it works fine. It doesn't appear to be a dirty bandswitch.

In all other respects the rig is fine and works very well actually, but I am intrigued what component my be at fault as it appears to be possibly heat related. Has anyone else found similar behaviour? Did you find a cure?

Thanks

Phil M0PBZ

21935. TS520 & VFO520

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-07-30 01:39:04 UTC
From: Rick
Topic: 21935 Message: 21935

I recently purchased a TS520 and a VFO520.

When I first hooked the VFO up the dial lamp came on but the VFO would not operate properly.

I checked the cable and someone had two wires on the same pins on eash end of the cable. So I removed the wire, checked the schematic and wired the plug accordingly.

Now the VFO operates properly. Or so it appears. However when I turn the rig on the VFO dial lamp comes on, even with the VFO in the off position. Is this normal?

So the next thing I did was take the VFO Plug that allows the rig to operate without the VFO being plugged in. The manual shows a jumper wire between pins 8 and 9. So I solder a jumper across those two pins. Unplugged the VFO, plugged in the single VFO plug but the rig would not receive.

Any suggestions for both questions?

Thanks in advance.

21936. Stolen Radios

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-07-30 04:12:36 UTC
From: AllanKB5DOH
Topic: 21936 Message: 21936

Hi, On July 25th 2009 at the Ham Holiday event the following radios were stole when buying any radios check the serial numbers see list below.
Thanks
Allan = kb5doh

The following equipment was stolen from a commercial vendors table at the recent Ham Holiday event in OKC.

Yaesu FT-450AT s/n 8L220116

Yaesu FT-8800R s/n 0504024

Additionally a used Kenwood TM-7950 2 Meter transceiver was taken from a flea market table.

The Oklahoma City Police should be informed if you gain any information on this equipment referencing police report 09-62313.

Thank you

Appears a previous owner improperly wired the remote VFO cable.

> However when I turn the rig on the VFO dial lamp comes on, even
> with the VFO in the off position. Is this normal?

Yes this is normal. The dial lamps will illuminate regardless of the
remote VFO's FUNCTION switch position with power applied to the 520.
VFO selection, whether it be internal or external or a combination
of both, are controlled by the remote VFO's FUNCTION switch with the
remote VFO plugged into the 520's rear VFO socket.

> So the next thing I did was take the VFO Plug that allows the rig

If the VFO plug you used is the original factory plug, the plug
should already have a jumper between pins 8 and 9. Looking at the
socket from the outside rear panel, which pins did you jumper?

The remote VFO pins on the socket AND plug (plug inserted into the
socket) are numbered counter clockwise starting with pin 1 on the
lower "right", continuing around the socket AND plug to pin 9 on the
lower "left". The separation at the bottom of the socket is between
pins 1 and 9.

21938. Re: TS820 Frequency Display Problem but OK after warm up

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-07-30 15:10:32 UTC
From: w5rkl
Topic: 21934 Message: 21938

Hello Phil,

If the erratic digital display does not affect the stability of the VFO when tuned then the problem most likely is caused by dirty contacts on the top, bottom, and possibly the internal Counter Unit assembly pin contacts.

The 5V-AVR Unit, mounted just to the rear of the Counter Unit, also may have dirty contacts on the pins and plug. The 5V-AVR Unit provides a regulated 5VDC to the Counter Unit through the bottom connection, accessed at the bottom of the Counter Unit.

Always remove the power cable from the wall outlet BEFORE attempting any cleaning of plugs, pins, etc. Never perform any cleaning while power is applied or the power cable is plugged into the wall outlet!

Clean the top and bottom Counter Unit and 5V-AVR pins and plugs with contact cleaner by applying a small mount of contact cleaner to the pins then insert and remove the plugs a few times. Use canned air to remove excess contact cleaner then wait 3 to 5 minutes before applying power. Contact cleaner is flammable and it only takes a small spark to ignite it.

If this fixes the problem, there is no need to go any further. However, if the problem still exists then I recommend removing the Counter Unit and cleaning the internal pins inside the Counter Unit.

To clean the internal pins inside the Counter Unit, remove both plugs, top, bottom, and the 5V-AVR plug from the 5V-AVR Unit.

Loosen the Counter Unit mounting screws and gently lift the Counter Unit from the 820.

Remove the outer metal covers from the Counter Unit. With the outer metal covers removed you will see 2 PC boards. One will be labeled "X54-1150-00" and the other labeled "X54-1160-00". The "X54-1150-00" will have an "edge" type connector, not pins. Some have used an eraser to clean the edge connector. I do not recommend this since using an eraser does NOT clean the edge connector "plug" pins that make contact to the "edge" connector. A clean "edge" connector is fine edge "plug" pins will still be dirty/corroded and possibly may not make good contact when inserted onto the edge connector.

Remove the mounting screws from "one" PC board at a time. Remove the PC board and give the pins a shot of contact cleaner. Gently insert and remove the PC board a few times. This provides a "scrubbing" type cleaning action to take place on both the pins and socket.

Insert the board into the pins, ensuring it sits flat onto the mounting holes then install and tighten the mounting screws. Do NOT over tighten the mounting screws.

Do the same with the other PC board then reinstall the Counter Unit into the 820 and insert all plugs including the 5V-AVR plug.

Again, use canned air to remove excess contact cleaner, wait 3 to 5 minutes before applying power. As I stated above, contact cleaner is flammable and it only takes a small spark to ignite it.

Power up the 820 to see if the problem is fixed.

Thanks for the reply Mike.

I wondered about that VFO lamp being on constantly.

I have the other plug operating properly now. When I originally soldered it there was a cold solder joint. Redid it this morning and all is well now. Rig operates with or without the VFO plugged in.

Now all I need to find is the matching AT-200 tuner.
Again Thanks for the info on the external VFO.

You're welcome Rick.

Your initial posting stated you installed a jumper in the plug.
That prompted me to comment about the plug's factory jumper
and the question asking which pins your jumper connected to.

The plug should have only one jumper and that jumper is between
pins 8 and 9. There should be NO other jumpers in the plug!

Use caution when soldering wires to the pins as the plastic easily
melts at high temperatures. In a pinch, a short piece of wire between
pins 8 and 9 on the rear of the 520 can substitute for the plug.
Again, no other jumpers are to be inserted into the rear VFO socket
when the remote VFO is not plugged into the 520.

The VFO cable is wired as a "straight through" cable. That means
pin 1 on one end connects to pin 1 on the other end. There are NO
cross over pin connections in the VFO cable!

21944. TS-520S no transmitt

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-07-30 20:39:49 UTC
From: Bob Singer
Topic: 21944 Message: 21944

My TS-520S will not transmit. I finally got the parts to fix the Vox board so that when you press the PTT switch on the mic or go to send on the front switch, it would kill the receive and click the two relays(didn't before). After replacing Q8, D8 and R16 on the Vox board, I thought I would ohm check the RL line from the Vox board. It checked shorted so I traced the white/purple line and found that some one before me had taken off the AF board, or at least unscrewed one of the screws, and when they replaced one of the screws, they tightened it down on the white/purple RL wire that goes from the RL pin on the AF board to the RL pin on the Generator board shorting it. I fixed that, rechecked all my connections and turned the radio on. Good audio and no smoke this time. I put the mode switch on to CW running the output of the radio into my dummy load and put the front panel switch into the send mode. The audio stopped but no output on my watt meter. I took the shield off of relay RL1 and did it again and it was working. Measured the voltage at relay RL2 when I flipped the send switch and got the 13v that is supposed to be there and it was working also. I thought I would check the plate idling current so I switched the front meter switch to IP and put the send switch up. I noticed the needle was at the 100 mark before and it stayed there in the send mode. switching the meter selector to any mode made no difference with maybe just a slight movement. The next item on the service manual flow chart is check S5 and then VC2. Can any help me out with where they are? Can any one lead me where to go next? All the plugs/switches in the back are where they are supposed to be and I took the shield off the finals and they are lighting up (yes the heater switch was on when I tried it).

"The next item on the service manual flow chart is check S5 and then VC2. Can any help me out with where they are?"

First, VC1 is the single section variable PLATE capacitor and VC2 is the multiple section (3 sections) variable LOAD capacitor. Both capacitors are located inside the final amplifier section.

S5, as a whole, is the band switch. Band switch wafer segments S5-1, S5-2, S5-3, and S5-4, however, are located inside the final amplifier. These 4 wafer switches control the following actions depending on the position of the band switch:

1. Control which turns on the PI Network coil are used (Adds or removes a short across unused coil turns)

2. Adds or removes parallel connections to sections of the variable LOAD capacitor VC2 and at the same time add or remove parallel connections to fixed capacitors C3, C4, C5, C6, C7, C8, C9, C10, and C101.

Hello Bob,

Although I said earlier-on, the coupler in the final cage may not be the source of the problem, after reading your responses I recommend checking each switch wafer, S5-1 thru S5-4, in the final cage to be sure they align properly on each band. If the wafers do not align properly, the final amplifier will not resonate on any band. IP dips using the PLATE control will be way off or no-existent, and RF output will be zero or very low.

A wafer that does not align exactly right can cause a capacitor be placed into the circuit, a coil turns in the PI network tank, or both, to be in the circuit when they shouldn't be. Some wafer switches have very little "wiggle" room so make sure the wafers are aligning properly on each band.

Some wafer switch can wear down due from usage over time which can result in an open circuit even if the wafer aligns properly. I have seen this happen in the some FUNCTION switch wafers so check continuity through the wafer switches to be sure there is no opens.

Hello Klas,

First, check the VOX GAIN control. It may be set too low.

Check for sidetone at pin 2 of V603. The mode switch must be in
CW mode, a CW key plugged into the rear CW socket, and the CW
key must be pressed to check for sidetone at pin 2 of V603.

If sidetone is not present at pin 2 of V603, check capacitor C619
(.01ufd disc capacitor) and R11, 1 meg resistor. If either component
is open, sidetone will not be applied to pin 2 of VOX AMPLIFIER
V603 which will prevent RELAY AMPLIFIER V302 from conducting.

Also check neon bulb, NE-601. When sidetone audio is present
at pin 6 of V603 and one side of NE-601, a change in grid voltage
on pin 2 of V302 occurs causing V302 to conduct, energizing relays
RL-1 and RL-2. If NE-601 is bad, even with sidetone audio present
at pin 6 of V603, the grid voltage at pin 2 of V302 will not change
resulting in V302 not conducting and relays RL-1 and RL-2 will not
energize.

Check VOX AMPLIFIER tubes V302 and RELAY AMPLIFIER V603. Replace any
weak tubes.

21953. FS: "Gordonized" TS-830s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-02 14:45:35 UTC
From: Joe McGerald
Topic: 21953 Message: 21953

This weekend I had the opportunity to purchase a TS-850SAT and so I'm going to sell my pristine TS-830s. It has been "Gordonized". In other words it has been tuned, cleaned and aligned by Gordon Benjamin. He also just replaced the HV capacitors in this rig and it works flawlessly. Cosmetically it's a 9+ with a few small marks on the top.

I am selling it complete with a matching MC-50 microphone, original instruction manual and a copy of the service manual.

I am asking $525 plus $55 UPS Shipping in the U.S. I can accept PayPal, otherwise U.S. Postal money order. You can pick it up locally in San Diego to save the shipping. I will consider a partial trade. I am looking for an MC-60 for the TS-850, an antenna tuner such as the MFJ-962D that will handle at least 600 watts, a QRP rig, and some other misc. If you are interested I would suggest calling me. I will be listing it later today on QRZ.com and QTH.com and it probably won't last long!

Email or call (619)840-8736. Thanks.
73.
Joe

I'll try to make the story short ☐ the original owner bought this radio in the 80's He used for like 20 hours and then re-packed and stored in a climate ☐controlled facility among other stuff like paintings, etc. He did an excellent job on packing this rig. When I received this rig at my house and unpacked, I just can't believe it ☐ this baby IS brand new.

As to why and how, I don't know neither I asked the original owner.

He has two of them, which I purchased both. I am keeping one and selling the other. I am asking $525.00 firm ☐ no trades. No warranty.

This sale is on a first come- first serve basis. I'll be out from August 10 to 20 2009.

You can contact me at wp3vv1@... or 787-564-2021

Thanks

Is it safe to use a modified sine wave power inverter to power a TS-530?

I have an 800 watt unit that I am sure would be adequate as far as capacity, but the inverter's literature indicates it is for resistive loads, not inductive loads. The other concern I have is the immediate power demand transmitting creates causing power drops and surges.

Anyone have any input or experience with this?

I haven't tried so this is theory only;
Although the TS-520 has a transformer input
it is mostly a resistive load, so should be no problem.

I have run equipment with variable loads and transformer-based power supplies from modified-sine inverters before with only a few minor problems. In particular, the inverter kicks out a lot of hash, which may be a problem on lower bands. Also, the "modified sine wave" has still got pretty square edges (hence the hash) and will break through as a buzz on audio. Perhaps some sort of mains filter would improve matters.

I haven't tried my TS-520 on a modified-sine inverter, but since I have both my TS-520 and such an inverter lying downstairs still not unpacked from IOTA I could give it a go. I wouldn't expect it to do any harm; it might just not work very well.

Hi,

What is the brand and model of the inverter,
most do not like inductive loads and will
have a lot of noise.

The main transformer on these radios is
expensive to replace if it fails.

Put it on a scope to see how clean it is.

I've used full sine wave UPS for field day and
also at my qth all the time no problems.

you can find APC brand Smart UPS fraction of
original cost at swapmeets or ebay, often without
the batteries, this can save you money on shipping.
The smartups series can be started without a/c
applied to the unit, great for power outages.

Is it safe to use a modified sine wave power inverter to power a TS-530?

I Anyone have any input or experience with this?

I agree with K8JD, why would you bother!! Plug it into the wall and use the internal sipply...The whole reason for DC to DC supplies was to run Tube output radios mobile i.e. off 12volts...Sure it would work but I cant imagine why you would want to do it.. Cheers Frank VK5KV..

OK, now I remember. All the standard equipment that is on my TS 520 became extra $ options on the 520 s and subsequent models like the 530 830 etc. one of those features was the dual 120 Vac/12VDC supply !!! One reason I got the Kenwood 520 over the Drake TR4CW was the standard equipment power supplies, the noise blanker and calibrator that were extra $ options on the Drake.

The DC-DC converter was standard on the 520 but optional on the
520S, 520SE, and 820.

The TS-530 and TS-830 do not have a DC-DC converter option.

Hi Guys. Perhaps he wants to run his station from solar/battery
power, or wants the option to run from 12V for emergency power.

Using an inverter is not very efficient, and maybe it would be a
better choice to use a solid state radio such as a TS-120S, or TS-130S
for such purposes, since they can run directly from 12V.

I have three HF radios here, a TS-530S, a TS-130SE, and a TS-430S,
plus a TM-261A 2M radio. I also have a 75 amp/hour deep cycle
battery. At present this batter is float charged with a 10 amp
supply, and is connected to the TM261A. I can easily connect it to the TS

TTYL-130SE or the TS-430S if I need to. However, I would not try to
run the TS-530S from the battery via an inverter. If I were to do
such a thing, I would only use an inverter that has a sinewave output,
not a "modified sinewave" output.

Just my $20.00 worth ($.02 adjusted for inflation!)

yes, the 830s did have a 12v dc option. All of the units made for sale outside of the USA came with a differant main transformer and a space on the back panel to mount the 'DS-2 converter'. I own two of those radios, one that was purchased in Singapore and the other from Japan. I have never been able to find a DS-2, but the schematic is in the manual and some day I'll build one.

I stand corrected! It appears the TS-830 (W model ONLY) does have an optional DS-2 DC option. The "W" model appears to have been only marketed outside the U.S. This could explain why the TS-830S operator's manual does not show the DC-2 as an optional accessory.

21980. RIT acting up on TS-830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-05 16:29:50 UTC
From: steveb84us
Topic: 21980 Message: 21980

I am posting this for a fellow TS-830S owner who is having trouble with his RIT control.

"I don't know if this is normal or not, but the RIT control seems to be acting up. When you first turn the radio on, and you press the switch, the red light comes on, and the knob seems to function normaly. But, after the radio is on for awhile, the frequency setting that you have made with the control will freeze up. I have turning off the RIT, and back on again, and it will still remain non functional, even with the red light on. If the radio is turned off for awhile, and then you turn it back on, then it will work."

If anyone has any ideas of how to solve this problem, please pass them along. Thanks in advance.

Steve - N9SB

Absolutely. It's a Kenwood. If I remember correctly the RIT switch assembly behind the front panel has a small pc board with a white multi-pin connector. Pull it off and reseat it a couple of times. Also push the switch in/out dozens of times to clean it.

Greg

21984. 830s drop in output

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-05 19:57:40 UTC
From: va3slj
Topic: 21984 Message: 21984

Here's where I am so far:

I have a Kenwood 830s that has, up to now, been working well (100w out on most bands). When I powered up last week, I can only get about 30 watts. Here's what I've checked and noticed:

1) The bias read too low, and usually does not require adjusting. I adjusted it to show 60 ma as per manual.
2) the voltage setting only shows 400, which I believe should be closer to 800.
3) the SGA(?) switch was not inadvertantly shut of.
4) The heater is on.
5) other than low output, everything seems to work. I tried all bands.
6) I did try it with the heater switched "off," and received the exact same readings.

I am no technician, but I wonder if it could be
1) the finals gone soft?
2) a failure at the heater switch.

I haven't had it open yet, but I assume there must be some glow from the tubes to get the 30w. If I can check the continuity of the heater switch, is it advisable/feasible to bypass it so the heater is always on? I realize this will draw more power, but is there any other danger in doing this?

Otherwise, I'll be investing in new finals and a new 12BY7, and trying to neutralize them.

The shack is a bit humid, and I wonder if some corrosion might have damaged the switch.

73,
Scott Jacobsen
VA3SLJ

Your HV caps have gone bad. You need to replace them.
Ken, K4EAA has replacement HV cap kits that are perfect.

From: L Kendall
Topic: 21935 Message: 21987

Not being entirely familiar with the Kenwood external VFO selection, I would like to know which models are compatible with the TS-830S "Gold."

If the number is greater than one, and there is a choice to make, which models are good ones to consider, and why?

I currently have a Kenwood TS-830S "Gold" with a VFO 120. Nothing wrong with the VFO. And it works great.

See, the problem is I have 2 of the TS-830S. But only the one external VFO.

Not a bad problem to have, right? But to get another external VFO, I would first like to hear opinions on what works best.

While you're at it, I'd like to hear opinions on Kenwood external speakers.

Normally I use noise-cancelling headphones. But sometimes ya gotta show off that great audio this rig has.

Thanks,
Larry

VFO-240, analog VFO, and VFO-230, digital VFO with 5 memories, will work fine with the TS-830S gold, silver, brown, or blue. The differences between the VFO's should be obvious. Matching SP-230 speaker works great with the 830 but I've used an old Lafayette 3-way bookshelf speaker and it works great too. Nothing like listening to the rumble of static through a 12 inch woofer. It gets the heart pumping.

The VFO-120 also works well. Similar to the 240 but smaller and cheaper.

Thanks, Pete.

I don't know why this did not occur to me before, but their are a bunch of guitar amp speakers up to 15" mounted into cabs around here. The freq response of many of those speakers drops quickly above 6 KHz or so. It might be worth a try, assuming the audio output impedance is in the neighborhood of 8 ohms.

If the radio does not have a rear panel PTT connector you should wire the footswitch into the front panel mic plug you wire to the microphone. The key jack is only for use in CW mode, it won't do anything for you in SSB.

Greg

you could also use the mfj 1261/1262/1263 for mike switching, they also have
the 1/4 jack on the back for foot/hand switch

If out of your budget, maybe clone for your needs...

fwiw I put a 1/8" mono jack on the back of my MC-50 and wired it into
the PTT button. I also added an rf choke on the foot switch cable to
prevent picking up extra RF on the microphone. Seems to work fine.

21995. Incorrect Frequency on DG-5 on 10m only

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-07 00:45:09 UTC
From: unnorml
Topic: 21995 Message: 21995

Greetings,

Currently boggled by an issue of my DG-5 displaying an incorrect frequency of the TS-520S on 10m only.
The same result is present no matter if the VFO on the TS-520S or the external VFO-520S is used. They have the same "offset" for a lack of better terms.

Here's the examples to make things easy:

Band: 28 MHz / Subdial: 200
28200 MHz dialed on the TS-520S yields a display of 27700 on the DG-5.
Band: 28.5 MHz / Subdial: 200
28700 MHz dialed on the TS-520S yields a display of 27200 on the DG-5.
Band: 29.1 MHz / Subdial: 200
29300 MHz dialed on the TS-520S yields a display of 26200 on the DG-5.

Yes the numbers are correct, I've performed a full alignment and attempted to adjust the VFO with no success.
Can't seem to figure out why the display is running out in the opposite direction.
Wondering if anyone else has experienced this issue or if you might know of the problem.

Any and all assistance with this will be greatly appreciated.

73,

Michael - KI4FDH

Hi Michael,

Are your LO frequencies correct when measured with a DFM? Is it
possible that the set has been modified for 11m?

Hi Kashia. I believe the best way to connect a foot switch to your
TS-830S is via the remote connector. I did this for a friend recently
for his TS-440Sat. Using shielded wire, make a short jumper with a 14
inline jack on one end, and a 7 pin connector on the other. You will
need to get the correct connector, as I do not believe that Kenwood
used standard 7 pin din plugs. Get the 7 pin din plug, and make sure
it fits the remote socket first. This way, you do noy have to midify
your mic, or radio.

Hi Guys. Sounds like it has been modded for 11M to me. Especially as the frequencies shown on the DG5-5 are all in the 11M range, and 10M is the only band that is off. Best to check the output into a dummy load with a frequency counter. If it has been modded for 11M, you will have to undo the mod.

21999. Re: Incorrect Frequency on DG-5 on 10m only

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-07 15:20:30 UTC
From: w5rkl
Topic: 21995 Message: 21999

As previously stated, it appears your 520S has been
modified to operate on the 11 meter band by some CB hacker.

Based on the information you provided, the list below is what I
believe are the heterodyne oscillator crystal frequencies the
CB Hacker used to replace the original 10 meter heterodyne oscillator
crystals, allowing the 520 to operate on 11 meters.

11 meter heterodyne oscillator crystal frequencies:

-BS --- HET CRYSTAL --- Receive and transmit band
-28.0 - 36.395Mhz ----> 27.5 Mhz (11 meters)
-28.5 - 35.895Mhz ----> 27.0 Mhz (11 meters)
-29.1 - 34.895Mhz ----> 26.0 Mhz (11 meters)

Note:

BS is short for "Band Switch".

To fix your problem, the original 10 meter heterodyne oscillator
crystals must replace the CB Hacker's 11 meter heterodyne oscillator
crystals. The list below are the original 10 meter heterodyne
oscillator crystal frequencies.

Original 10 meter heterodyne oscillator crystal frequencies:

-BS -- HET CRYSTAL - Receive and transmit band
28.0 - 36.895Mhz --- 28.0, (10 meters)
29.5 - 37.395Mhz --- 28.5, (10 meters)
29.1 - 37.995Mhz --- 29.1, (10 meters)

BS is short for "Band Switch".

The DG-5 has a "COUNT IN" socket on the rear of the DG-5.
Remove all cables between the 520S and the DG-5 "except" for the
power cable. Connect one cable between the HET socket on the rear of
the 520S and the DG-5's COUNT IN socket. Set the DG-5's front panel
slide switch to COUNTER. Set the band switch to each 10 meter band
switch setting. The DG-5 will display the 520's RF UNIT heterodyne
oscillator frequency for each band switch setting. I suspect the
DG-5 will display frequencies that are similar to or quite close to
the 11 meter heterodyne oscillator crystal frequencies I provided
above.

The 11 meter modification to the 520 does not include modifying the VFO or any other crystal oscillator such as the CAR UNIT. You can verify the VFO output top and bottom frequencies by moving the cable connected to the HET socket on the rear of the 520 to the VFO socket. Tune the VFO to a dial setting of zero. The DG-5 should display 5.500Mhz. Tune the VFO ti a dial setting of 500. The DG-5 should display 5.000Mhz. Mechanical dial calibration on both internal and remote VFOs will affect the accuracy of the DG-5 VFO frequency display.

To verify the CAR UNIT crystal frequencies, move the cable connected to the 520's rear HET socket and connect it to the CAR socket. The list below is the normal CAR UNIT crystal frequencies based on the position of the mode switch.

CW receive - 3395.0Mhz
USB receive - 3396.5Mhz
LSB receive - 3393.5Mhz

Age and CAR UNIT alignment can and will affect the accuracy of the CAR UNIT crystal frequencies. However, the CAR UNIT crystal frequencies should be close to the frequency list provided above.

Replacement crystals can be obtained from International Crystals in Oklahoma City, Oklahoma. International Crystals has an archive list of all manufacturers they provide crystals for and they can easily determine the correct crystal type and holder. All you have to do is tell them what circuit the crystal is being used for and the crystal frequency. See the list of "ORIGINAL" heterodyne oscillator crystal frequencies when ordering replacement crystals.

I also recommend performing a thorough inspection of the final amplifier including the PI Network's LOAD circuitry which includes the fixed LOAD capacitors and band switch wafer wiring for any changes that may have been done by the CB Hacker during the 11 meter conversion. Consult the 520S service manual's parts list AND schematic for further details.

Also, I recommend reviewing the 520's service manual and schematic for details on alignment. More than likely you will have to perform an alignment of the 10 meter band. Do not perform an alignment until you are sure all of the components and crystals that were changed by the CB Hacker have been replaced with original components/crystals.

I am NOT a CB Hacker but I do understand how the signal conversion process takes place in the 520 in both transmit and receive. If you desire additional information drop me an e-mail.

22001. Help needed on digital display on TS-820(s)

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-07 22:45:48 UTC
From: Ken
Topic: 22001 Message: 22001

I have a TS-820 with the digital display option. Some times it acts funny, and I'll try to explain what it does. On the digital display 14.2XX.0 for example, the XX 8 will be 0 and 9 will be 1 only acting up on the segments marked XX. Any idea what component would cause this? It seems to be somewhat temperature sensitive.
Thanks Ken WA0NVT

22002. Re: Help needed on digital display on TS-820(s)

Topic: 22001 Message: 22002

Hello Ken,

If the 820 is otherwise operating normally, I would suspect the Counter Unit's internal fix pins connecting the 2 internal PC boards together. Over time the internal pins and sockets can become dirty creating strange operation.

Removing the Counter Unit assembly is not difficult. Remove all power from the 820 and remove the top and bottom covers.

Remove the top and bottom plugs to the Counter Unit then loosen the assembly mounting screws.

Gently remove the Counter Unit assembly from the 820 then remove the outer cover.

Remove the PC board mounting screws, one board at a time.

Gently remove the board and apply contact cleaner to the pins and the board's sockets. Install and remove the board a few times. This allows a cleaning scrubbing action to take place between the pins and sockets. Install the board and secure it to the metal enclosure with the mounting screws, ensuring each mounting screw it tight. Do not over-tighten the mounting screws.

Do the same thing with the other board.

Use canned air, found at Walmart, to remove excess contact cleaner.

Install the metal enclosure and tighten the cover screws.

Clean the top and bottom pins on the Counter Unit with contact cleaner and reinstall the Counter Unit in the 820 and reconnect the top and bottom plugs.

Again, use canned air to remove excess contact cleaner.

Wait 3 to 5 minutes before applying power. Contact cleaner is flammable. It only takes a small spark to ignite it.

It doesn't take much contact cleaner so do not soak the pins and sockets. A little bit goes a long way.

Check for proper operation.

22003. AT-200 Tuner Low Power Reading vs. Bird and KW SW-2000 Powermeters

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-07 22:49:28 UTC
From: unnorml
Topic: 22003 Message: 22003

Greetings all,

I have a bit of a discrepancy between my Kenwood AT-200 Tuner set to measure power vs. my Bird wattmeter.

The AT-200 reads lower power output as compared to the Bird.

I notice that the Bird will read 100W out on 14 MHz from my TS-520S and the AT-200 will peak at 100W then drop to 80W immediately.
I even checked on my Kenwood SW-2000 and measured from my dummy load all resulting with around 100W with exception of the tuner.

Anyone got a theory behind this one?

Figured I'd post it before opening up the AT-200

73,
Mike - KI4FDH

22007. Odd RF gain/AGC problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-08 09:37:26 UTC
From: martin
Topic: 22001 Message: 22007

Hi Folks. I am having an odd problem on my TS-530S. I find no mention of this problem in the archives. When I turn the RF gain up (clockwise) past 8.5 there seems to be a slight loss of sensitivity, and it takes a strong (S-8 or higher) signal for the S-meter to move. I can still hear weaker signals ok, just no meter movement. I first noticed this on a quiet band. The band noise drops off slightly as the RF gain is rotated past 8.5.

This happens in USB, LSB, and CW modes, and with the AGC set to fast slow or off. It happens on all bands. In testing this, I peaked the Drive control for maximum signal with the calibrator on each band. The meter works fine to read bias current, and works like it should in all tuning and transmit settings. I am not getting any audio distortion, the radio still sounds good on RX as it always has. The radio tunes up and transmits fine.

I cleaned the RF gain pot with DeOxid D5 solution, and it made no difference.

Any ideas as to where I should start looking?

Topic: 22003 Message: 22008

what range (in watts) is the slug you are using in the bird meter?

consider that the bird meter is designed for the sole purpose of
measurement. it is a piece of test equipment.

now consider that the matching network (i have a problem with calling a
matching network a "tuner") is designed to match the impedance.
effectively, it is a transformer. it's not designed to be a measurement
tool. the important measurement that it does make is the *ratio* of
power out / to power that is reflected back.

sounds normal to me. as the rf gain is turned, yes receive does reduce. that is how they eliminate unwanted signals, and the needle goes up

Hello Everyone

I wonder if anyone has put a 12 V light bulb in their AT-200?

I just picked up a nice AT-200 and thought it would be nice to have a light to show the meter better.

So if you have done this mod could you please post your results.

Thanks

I just had someone else ask me about that (http://www.frontiernet.net/~jpnast/jeff.html). My response:

Hello John!

I originally took apart my tuner because of problems on 160m. Found a fried wafer switch. Looked like lightning got it. Ordered the last one in stock and got it fixed.

While inside the case, I noticed that the meter had the same kind of lamp housing as the meters in the TS-520S. Got me thinking that it would be nice to be able to actually see the meter in low light conditions.

Since I like the warmer glow of incandescent lamps, I decided not to go the way of LEDs. I ordered lamps from East Coast (http://www.kenwoodparts.com/). The originals sub to another part number, but they fit fine. Though a bit spendy. Get a couple extra...

I mounted the lamps inside and ran a small power cable out through one of the lower corners. The cover does not perfectly match the backplate so there is a gap that I used, saving me from drilling a hole. I used tie wraps inside and out for strain relief. About 6" outside of the case I put a two conductor molex connector so it would be easy to disconnect.

The other end of the power cable ended up in the External VFO connector. The VFO-520S lamps have to be powered through the connector, so I tapped into pin 3 for ground and pin 4 for what I believe is the +13.8v. Please double check to make sure. It's late...

Sure is nice to see that meter in the dark. How's that for a lengthy answer to a short question? ;-) Hope it helps. 73!

22016. Re: AT-200 METER LAMP

Yahoo group: TS-520_820_530_830 (2009)

From: unnorml
Topic: 22013 Message: 22016

Hi Rick,

I did this to my AT-200, It's nice when the meter lights up to match the transceiver. Simple mod, I had some spare lamps left over from relamping my 520S and used the grommets from a spare VFO-520 that I had for spare parts. The meter on the AT-200 already has the cut-outs for mounting the lamps in the grommets to the top of the meter (exactly the same as the ALC meter on the Kenwood transceivers).

WARNING: I recommend you use connectors for power (positive and negative) with no chasis grounding.

Option (1): connect a 12VAC wall power supply to the lamps in the tuner.

Option (2) for use with a Kenwood Transciever.

Drill a small hole in the back panel of both the tuner and transceiver to accommodate a stereo 1/8" phone jack (Radio Shack part #274-0249). Or I would rather you use a power connector that will not short if you plug in or unplug the connector if it's turned on. Keep in mind the lamps run on 12VAC not DC.
Make sure your connections are to the 2 (pins 2 & 3) inner conductors and stay away from the ground conductor (pin 1), this will short 1 of the AC legs to the chasis ground. Bad things happen if this is done.
This is also the drawback to using these connectors, you don't want to plug or unplug the tuner to the transceiver or visa-versa if the transceiver is turned on. But it's my rig and I leave it plugged in at all times.

I used the terminal up next to my ALC meter on the 520S which is where the lamps for the 520S are tied to the 12VAC. I'm not sure what model transceiver your using but I'm sure the schematics are available somewhere.
I mounted the phone jack in the removable panel on the back of my transceiver and connected to the AT-200 with a stereo phone connector and "let there be light". Lights come on (on the tuner) when you turn on the transceiver. Pretty sweet at night too.

Hope all goes well.

73,

Mike - KI4FDH

Thanks for the info Jeff.
I just picked the tuner up yesterday so I have not taken the cabinet off it yet. So knowing the lamp holders are already in place is interesting.

I can not use the External VFO lamp voltage as I have a VFO-520 hooked up. But no big deal, a small external supply will do the job.

Thanks for the help.

22019. Re: Odd RF gain/AGC problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-08 19:09:42 UTC
From: w5rkl
Topic: 22001 Message: 22019

The 530's receiver gain and S meter movement is controlled in two ways:

1. RF Gain control (manually)

or

2. AGC voltage (automatic)

The RF Gain control, controls the receivers gain "manually" by varying the normal operating bias to the receiver's RF amplifier Q1 (RF UNIT), and both IF amplifiers Q2 and Q3 (IF UNIT). The RF Gain control also "manually" controls the meter amplifiers Q7 and Q8. Rotating the RF gain control, clockwise or counter clockwise, produces a change in the receiver's operating bias that results in a reduction or increase in receiver gain and a change in meter movement.

AGC controls the gain of the receiver by feeding the output of Q4 on the IF UNIT to the AGC circuit, Q5 and Q6. The same receiver gain control and meter movement occurs as with the RF gain control with one exception, it's all done "automatically".

A weak signal can easily be heard without producing any S meter movement! This does not indicate a problem with the 530's receiver.

Turning the AGC switch to "OFF" eliminates any automatic gain control (AGC) of the 530 receiver. The only gain control is the RF Gain control.

The "SLOW" and "FAST" AGC settings control the discharge time of the AGC voltage created by Q5 and Q6. The discharge rate determines how fast or slow the receiver's gain recovers from the incoming signal. In the "SLOW" position the AGC circuit operates in a "FAST ATTACK, SLOW DECAY" mode. In the "FAST" position, the AGC circuit operates with "FAST ATTACK, FAST DECAY" mode. The difference is based on the AGC RC time constant circuits selected by the AGC switch.

22021. Re: [TS-520_820_530_830] Odd RF gain/AGC problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-09 04:32:25 UTC
From: martin
Topic: 22001 Message: 22021

Hi Dave. I guess I did not explain clearly enough. When I rotate the
RF gain counter-clockwise from 8.5 it acts as you say, and that is
normal. I am talking about when I rotate the RF gain CLOCKWISE past
8.5. That is when the behavior that I described takes place.
Starting with the RF gain all the way counter-clockwise (set at 0) and
rotating it CLOCKWISE, everything acts as it should until the RF gain
gets to 8.5. As the RF gain is rotated past 8.5, the band noise drops
off slightly, and when the control is set at 10, it takes an S-7 to
S-8 signal to make the meter move. I still hear signals, but at that
point only signals stronger than S-7-S-8 make the meter move.

I hope that this makes the problem clear to you.

TTYL.

22023. Re: Odd RF gain/AGC problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-09 15:31:43 UTC
From: w5rkl
Topic: 22001 Message: 22023

Hello Martin,

I recommend performing the following voltage checks on the AF UNIT
using a DC volt meter.

Step 1

TP6
Voltage should be 9VDC (+/- .05VDC)
VR2 pot on the AF UNIT adjust this voltage to specifications.

Step 2

AF UNIT
Plug 11 pin 5 -- Voltage should be 3.2VDC (+/- .05VDC)
VR3 pot on the AF UNIT adjust this voltage to specifications.

Note:
The Rectifier Unit's 14VDC supply is the source voltage applied
to the AF UNIT for the creation of the 9VDC. The 9VDC is the
source voltage for the 3.2VDC.

Perform the checks and adjustments in the order shown above,
9VDC first followed by the 3.2VDC. Do not perform the adjustments
in reverse order as this will cause the 3.2VDC to be wrong.

If the voltage being applied through the RF Gain control to the RF
and IF amplifiers as mentioned in my previous response is higher than
the normal operating voltages to these stages, it is quite possible
this could lead to the symptoms you are experiencing.

This, or course, is assuming that all other circuits are within
specifications and working properly.

Mike W5RKL

22024. Tune Mode Repair & Meter Lamp

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-09 18:08:15 UTC
From: L Kendall
Topic: 22001 Message: 22024

Mike,

You may recall a few weeks ago you recommended replacement of resistors R15 and R16 on the rectifier card of a TS-830S (G) that had an "inop" tune mode.
I never did follow up, and apologize for the delay in doing so.
Sure enough, R15 was open, or at least in the mega-ohms.
It all works fine now as far as I can tell. Just thought I would let you know. You probably saved me a lot of time troubleshooting and I appreciate that.

Now I've realized the lamp (for the meter) is not working.
Can you tell me what the direct replacement is, or if not, what a suitable replacement is?
I didn't realize the meter even had a lamp until I saw other TS-830S rigs demonstrated on Youtube...duh.

Thanks,

Larry K5END

Lo and behold, K4EAA has these panel lamps for sale.

Google is ones friend. :)

Topic: 22001 Message: 22029

Hi Mike. I have checked and adjusted the voltages. Voltage at TP6 was 8.98V, now adjusted to 9V. Voltage at plug 11 pin 5 was 3.13V, now adjusted to 3.2V. The problem persists. Upon measuring the voltages on the RF gain pot (looking at the front of the radio, with the radio upside down):
The right terminal measures 3.2V no matter where the RF gain is set.
The left terminal measures 0.83V no matter where the RF gain is set.
The center terminal varies between 0.83V and 3.2V depending on the setting of the RF gain.
With the RF gain set at 8.5 (this is where I get maximum noise) the voltage on the center terminal of the RF gain pot is 3.03V, and the S-meter reads S-2

It seems likely to me that a bias resister for Q1 on the RF board, or for Q2 or Q3 on the IF board has changed value. Since the problem occurs with the AGC switch in any position, I don't think the problem is in the AGC circuit.

With the RF gain set to 10, the S-meter rests at) as it should.

I notice that neither the user manual nor the service manual for the TS-530S has a diagram for the RF board.

What do you think?

12 volts, 50 ma, and I bought a set from K4EAA and they work terrific. You can push the old lamp out of the rubber mounting gasket and replace with the new, then solder to the old wires and use a little shrinkwrap.

The VFO range is the same. Adding 160M has nothing to do with the VFO. They just added an additional bandswitch segment the necessary heterodyne oscillator crystal and coils for the het/mixer/driver/antenna circuits. I would check the schematic of the 520 VFO with regard to the interface with the radio and compare it with the 52oS VFO. That's one way to know for sure.

There is no difference between the VFO520 and VFO520S except for physical appearance.

When using the remote VFO remove the shorting plug or, if a short piece of wire is connected between pins 8 and 9, remove it. Pins 8 and 9 of the remote VFO socket on the 520 is only required when the remote VFO is not used.

Greg is right. One addition comment. The 520 VFOs do not change frequencies when the band switch is changed. The VFO520 and VFO820 plus the 520 and 820 series internal VFOs ALL operate on a fixed range of frequencies between 5.000Mhz and 5.500Mhz on ALL bands and ALL modes.

I just got my 520SE last week. Bought it with the VFO and speaker. The only surprise I found with regard to the remote VFO operation is that there is actually a switch position On the transceiver to zero beat the remote VFO with the transceiver VFO. Very nice indeed. I didn't realize anyone had this feature but I applaud Kenwood albeit 28 years after the fact. My radio was bought in 1981. So far I am very favorably impressed with it. I did replace the original S-2001 finals, the 12BY7A and the HV filter caps but other than that it appears to be in like new performing condition.

Greg,

Glad to hear you are enjoying your 520S and VFO520.

The TS-520S and VFO-520 combination allows you to operate both transmit and receive with either the internal or external VFO. The combination also allows you to operate split, transmit on one frequency using the internal VFO and receiving on another frequency using the external VFO or vice verse, all depending on the position of the remote VFO's Function switch. Of course this feature can only be performed on the same band AND within a certain limit in frequency separation.

The VFO zero beat function is, as you say, a nice feature and is included in the 520 and 820 series transceivers and remote VFOs.

Enjoy Greg.

Mike W5RKL

I've just tried that - what a great feature, I had no idea it was there. I guess you can never read the manual too many times.

Like I said, Mike

It surprised me to find the feature. I had an 80S with their digital remote VFO and it never had that. I guess its because they thought you wouldn't need it with a digital readout on both VFO's.

A buddy is dropping of an octal male plug at work tomorrow so I can use my linear with the 520SE. That will be good too....

Subject: [TS-520_820_530_830] Re: VFO520 with 520s

Greg,

Glad to hear you are enjoying your 520S and VFO520.

The TS-520S and VFO-520 combination allows you to operate both
transmit and receive with either the internal or external
VFO. The combination also allows you to operate split,
transmit on one frequency using the internal VFO and receiving
on another frequency using the external VFO or vice
verse, all depending on the position of the remote VFO's
Function switch. Of course this feature can only be performed
on the same band AND within a certain limit in frequency
separation.

The VFO zero beat function is, as you say, a nice feature and
is included in the 520 and 820 series transceivers and remote
VFOs.

Enjoy Greg.

Mike W5RKL

I did replace the original S-2001 finals, the 12BY7A and the HV filter caps but other than that it appears to be in like new performing condition.

From: w5rkl
Topic: 22036 Message: 22045

Greg and others,

Yes, you are correct, the TS-530 and TS-830 when used with the VFO-230 or VFO-240 do not have the same RMT CAL feature the TS-520 and TS-820 when used with the VFO-520 and VFO-820 have.

The VFO-230 and VFO-240, when used with the TS-530 and TS-830 transceivers, have a feature called "T-F SET". Consult the VFO-230 and VFO-240 operator's manual for further details on this and other features.

One last comment which I think is important since a number of questions have cropped up on this and other ham forums inquiring about remote VFO compatibilities. Questions such as:

"I found a VFO-230 on eBay. Can I connect the VFO-230 to my TS-820?"

or

"I have a TS-530S. I saw an ad for a VFO-520 on the Internet for a cheap price. Can I connect the VFO-520 to my TS-530?"

The answer to both questions is "No" and here is "one" of the reasons why:

1. The TS-520 and TS-820 internal AND remote VFO frequencies operate between 5.000Mhz and 5.500Mhz.

2. The TS-530 and TS-830 internal AND remote VFO frequencies operate between 5.500Mhz and 6.000Mhz.

The bottom line is:

1. The VFO-520 and VFO-820 are ONLY compatible with the TS-520 and TS-820 transceivers.

2. The VFO-230 and VFO-240 are ONLY compatible with the TS-530 and TS-830 transceivers.

73s
Mike W5RKL

22046. Coax Conflict - TS-520S IF modification for SM-220 Pan Adaptor

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-13 03:24:06 UTC
From: unnorml
Topic: 22046 Message: 22046

Greetings all,

I was going to modify my TS-520S so as to use my SM-220's BS-5 pan adapter for the pan display as per pgs. 11 & 20 of the SM-220 Manual.
Here lies my confusion, the modification calls for the installation of "RG-174/U 75 ohm miniature coaxial cable".
To my recent knowledge RG-174/U coax is 50 ohm coax.
I've searched hi & low to see if someone out there has performed this mod and what type of cable is required.

I thought that maybe it was a misprint but...
I have (2) different manuals, one newer than the other and the both state the "RG-174/U 75 ohm miniature coaxial cable".

Is it RG-174/U or is it 75 ohm coax?
Closest thing I can find with 75 ohm impedance is RG-179.
I have some RG-174 to use but am hesitant due to not knowing if 50 or 75 ohm coax is required.

Any and all suggestions are extremely welcome.

73,

Mike - KI4FDH

22047. Re: [TS-520_820_530_830] Coax Conflict - TS-520S IF modification for SM-220 Pan Adaptor

Yahoo group: TS-520_820_530_830 (2009)

From: Lou Blasco
Topic: 22046 Message: 22047

Hi Mike,

You're right, RG174 has a nominal impedance of 50 ohms. The manual is wrong.

http://www.generalcable.com/NR/rdonlyres/9C48F422-02D2-4062-B078-3C3BCF2D14A9/0/Pg087_RG174U.pdf

Go ahead and use your 174 coax. At the cable lengths involved the
nominal impedance will make no practical difference.

Regards

Lou

Eric,

I could use a couple of the toggle switches if you have them. My Send/Rec paddle is broken. What is the cost with shipping to Phoenix, AZ?

Rg174 is 50 ohm cable but such a short run should make no difference between a miniture 75 or 50 ohm line !!

22052. Mic mystery

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-14 15:34:48 UTC
From: Bob Singer
Topic: 22052 Message: 22052

OK, so after all the posts on the Astatic D104 with the G base, I have a question about wiring. For the 520S, the manual shows mic audio goes to pin 1, mic key is pin 2&3 and audio ground (shield) is pin 4. On the diagram I downloaded for the wiring on the D104 G base, it shows the mic key is a SPST switch. In the open position, it connects the mic audio wire to ground (the center position of the mic key switch is ground) and in the closed position, it grounds the red wire. There is no seperate mic key circuit. I thought the mic key had to connect to pin 2 and 3 on the 520S. Will the G base work the way it comes factory wired on the radio?

Thanks.
Bob KD?EEZ

Internally the two grounds are connected together anyway. What you
probably have there is something that shorts across the mike with the
key up, and shorts the PTT line to ground with the key down. As long as
you've got the plug wired up correctly with regards to the mike and PTT
line, it should be okay.

FYI,

If the D-104 is an amplified version Astatic cuts off the B+ (9v battery) when the PTT is not engaged to preserve battery life as well. I never had a problem using the PTT as specified in the Astatic drawing with any transmitter/transceiver. Astatic’s PTT is open on receive/closed to ground on transmit.

Very simple,

Greg

Ok but there is no connection to pin 3 that will short pin 2&3 together
on the 520S that I can tell. I was under the understanding that they
had to be shorted together and not one to chassis ground.

From: Greg Anders
Topic: 22052 Message: 22058

Should work fine, the unamplified D-104 is Hi-Z. If the response is tilted too much toward the high end of the audio passband you could hang a 1meg resistor on the audio line to ground inside the base if you want to tone it down. D-104's and other crystal mics think they are looking into a capacitive load when the mic stage input is <1meg. It looks like the transistor in the 52-SE has a 22k resistor to ground on the base input so it may sound a bit bright.

FYI,

Greg

On my TS-520 both grounds are connected together, and then back to
chassis ground.

Topic: 22060 Message: 22060

I've picked up a 1976 vintage TS-520 (I missed my last one), and I've run into an odd power output problem.

It's putting out 15W on 80m, 30W on 40M, 55W on 20M, and 90W on 15M and 10M. That's exactly opposite from what I would expect. I've checked the tubes, the bias current, the plate current, and the HV. All are as expected. I've followed Clif's alignment procedure and the power output went up a little. The receiver appears to be working fine.

So, I'm now looking for tips for troubleshooting this. Any suggestions?

Hi Bob. The TS-520S requires that the PTT circuit be totally separate
from the audio shield. You may have to change the wiring inside the
base of the mic. It is OK for the mic wire to be connected all the
time. In fact, it has to be if you ever would want to use VOX (I do
not recommend using VOX at all).The PTT switch in the mic has to
connect pins 2 and 3 on the mic plug, without either of these wires
being connected to the audio shield.

The D-104 mics were made for CB radios, and they needed to be wired
differently.

22062. TS-830S Gold power output

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-14 18:46:38 UTC
From: L Kendall
Topic: 22060 Message: 22062

What are typical power output levels for the TS-830S?

Before someone says it, YES, I am well aware the difference between 85 Watts and 115 Watts is only 1.5 dB or so.

With a Bird meter and 250H element I'm getting (after tuning, dipping, etc, of course) around 85 Watts max at 3.5 MHz and 95 Watts at 14.2 MHz.

It is stable output and does not decay. (I don't keep it keyed down for more than 5 seconds at max power.) From this I infer the tubes are probably OK.

I have verified the cables are not lossy.

It could be the Bird meter or element, and I have not ruled it out.

Ok. I will have to put a 4 lug terminal under the base instead of the 3 lug one so I can isolate the mic key circuit. That's what I thought.

From: Don Thomas
Topic: 22066 Message: 22066

Drawing straws here. By chance does anyone have an extra BT-5 Battery case for the old Kenwood TH handhelds? The BT-5 is the one that uses 6 "AA" battery's. A local ham is looking for one if available somewhere to use on his TH-215A.

From: Greg Anders
Topic: 22060 Message: 22067

The question about antenna vs. dummy load is highly relevant. If your antenna isn't resonant with low SWR on all bands power output can vary dramatically (laws of physics).When you get maximum power @15Won 80M you say that plate current is as expected. Does that mean you see 200-220ma? For 80M typically the load control on a 520 should be almost fully counter clockwise to get out maximum power. If you dip the plate on 80M then start rotating the load control to add loading and see your power output decline with rising plate current then you either don't have enough drive (bad 12BY7 or have mis-aligned coils) OR you have soft finals.

BTW,. The receiver on a 520 can tune thru the drive control to maximum sensitivity and your transmitter can still be out of alignment. I don't know if you are aware but the transmitter driver ircuit uses a different set of coils (driver coils) while the receiver uses those in the pictures marked antenna coils. Oftern people screw around with both of these and don't realize that they need to be peaked at the same point for a frequency. My 520SE arrived two weeks ago from a previous owner who said he could only get 40W output on 75M. Well, that's because on 3800khz the receiver peaked with the drive control at 2 o'clock whereas the transmitter driver circuit peaked at 10 o"clock.
So, I would check to see where the drive control peaks on receive, then go to CW and see where it peaks on transmit. If the point are different you need to sync the antenna coils with the driver coils. If they are identical the cause is elsewhere.

22068. RE: [TS-520_820_530_830] TS-830S Gold power output

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-14 21:27:47 UTC
From: Greg Anders
Topic: 22060 Message: 22068

The cause could be many things. It depends if you are tuning into an antenna or dummy load. If its an antenna and its resonant on one band and has high SWR/reactance on another you will see drastically different power output.

General causes if you are measuring output into a dummy include but are not limited to

1. Bad final or driver tube.

2. Misalignment in the transceiver (if band specific it would be either the heterodyne oscillator, mixer coils or driver/antenna coils on a specific band)

3. Drooping HV due to aged/failing electrolytic (Should be 850V no load dropping only to around 750-760V full load.) This would however be uniform most likely on several bands.

4. I had three 830S transceivers over the years and in peak condition (aligned and good tubes) always got around 100-120W on 80M about the same on 40/20M and only dropping to 90W on 10M. The drop is inevitable with 6146 tubes.

Check your watt meter first and use a dummy load for correct comparison if you were using an antenna.

Thanks.

Using dummy load, Berd Termaline. I meant to include that in the original post.

Your suggestion #3 is my suspicion as well. The rig has not been used in many years.

I still have not ruled out the meter or element. There may be no problem with the radio at all. Somewhere I had a calibration procedure, or at least a test, for the model 43.

The rig is hardly used. I'm not concerned about the tubes just yet.

I'll use an "O" scope to investigate #2. Maybe the waveform would show something unusual?

I have been thru these radios many times... If your caps are getting old they will get leaky and start acting like resistors. The 520S I just went thru got new caps immediately since it is 28 years old.

If you check the peaking point between receive/transmit on the drive control on a specific frequency that will tell you if the driver and antenna coils are aligned to peak at the same frequency. The mixer coils should also be checked to see if they are peaked. The heterodyne oscillator coil for any band it less sensitive. If it is way off in one direction your receiver should be somewhat deaf and transmitter power reduced, In the other direction once you get past the peak the oscillator will shut off like a light switch and you won't get anything thru the receiver or transmitter. If you suspect alignment pick a frequency, peak the receiver and see if you get maximoum transmit drive without moving the drive control. If you do, fine, if not then someone has tweeked either the antenna coil or the driver coil and not synchronized them.

Gud luck,

Greg

Looking at the workshop manual I'm not sure why this would be the case.
What's so different between the 520S and the 520?

I also looked at the sechmatic and saw that pin 3 on the mic input goes
to chassis ground.

Hi Mark. What type of meter are you using to measure the power output? The reason I asked is that some meters (designed for 11M CB use) might give this kind of result, as they are not designed to work on the lower bands.

I deleted your original post in haste so now I wonder if this low power is on 10M?
New , out of the box myt
TS 520 never quiite hit 100 W on 10, now it has 100 w on all bands except 65 W on 10 on the 2nd set of tubes.
Not using the rig is harder on the HV filter caps than ocassional use. My 520 gets used a few times a week for the last 30+ years and still has a little over 820 V no load and 800v under full transmit power.
I only use it on CW.
The ssb works when I test it but fone is just not my thing.

I have been thru these radios many times... If your caps are getting old they will get leaky and start acting like resistors. The 520S I just went thru got new caps immediately since it is 28 years old.

If you check the peaking point between receive/transmit on the drive control on a specific frequency that will tell you if the driver and antenna coils are aligned to peak at the same frequency. The mixer coils should also be checked to see if they are peaked. The heterodyne oscillator coil for any band it less sensitive. If it is way off in one direction your receiver should be somewhat deaf and transmitter power reduced, In the other direction once you get past the peak the oscillator will shut off like a light switch and you won't get anything thru the receiver or transmitter. If you suspect alignment pick a frequency, peak the receiver and see if you get maximoum transmit drive without moving the drive control. If you do, fine, if not then someone has tweeked either the antenna coil or the driver coil and not synchronized them.

Gud luck,

Greg

Thanks.

Using dummy load, Berd Termaline. I meant to include that in the
original post.

Your suggestion #3 is my suspicion as well. The rig has not been used in many years.

I still have not ruled out the meter or element. There may be no problem with the radio at all. Somewhere I had a calibration procedure, or at least a test, for the model 43.

The rig is hardly used. I'm not concerned about the tubes just yet.

I'll use an "O" scope to investigate #2. Maybe the waveform would show something unusual?

>3. Drooping HV due to aged/failing electrolytic (Should be 850V no load dropping only to around 750-760V full load.) This would however be uniform most likely on several bands.

From: k5lcl@sbcglobal.net
Topic: 22001 Message: 22079

I'm not real sure I understand which digit(s) is acting up, but on my 820 (with the digital modification) the last digit or two would blink/rapidly change. I tried the quick fix of disconnecting the DG-1 leads from the frequency counter, and cleaning them with De-Oxit, to no avail. Then I just happened to notice it would sometimes quit acting up when I changed bands. I unplugged it and I sprayed the band switch contacts with De-Oxit, switched bands several times to clean the switch, blew it dry with compressed air, (with it still unplugged of course), and it corrected the problem. No more digits blinking and changing rapidly.

Subject: [TS-520_820_530_830] Help needed on digital display on TS-820(s)

I have a TS-820 with the digital display option. Some times it acts funny, and I'll try to explain what it does. On the digital display 14.2XX.0 for example, the XX 8 will be 0 and 9 will be 1 only acting up on the segments marked XX. Any idea what component would cause this? It seems to be somewhat temperature sensitive.
Thanks Ken WA0NVT

Well, that was the best tip I've had. Turns out the meter I was using is rated from 20MHz to 1GHz. I didn't even think about that.

The radio is putting out a solid 125W on 40M and 80M. I guess the tubes are strong. I guess I learned how to align the thing, and to double check my equipment next time.

No, it measures lower on 80 meters.

I'm starting to suspect the Bird meter may have a problem. Now checking
on calibration.

In the meantime I'll be looking at the Hi voltage electrolytic caps as
well. Will probably scope them for sag or ripple under a load.

1. Turn off the screen grid.

2. Set your transmitter to 28.5 mhz

3. Put a scope or RF meter on the output.

4. Tune the neutralizing cap for minimum output....

Takes 5 minutes.

Just a thought.

Tune the 830 up using normal tune up procedures, 830 connected to
a dummy load. Switch to CW mode, close the CW key, and note the
HV and IP meter readings. You may have to tweat the tune up
adjustments in CW mode and possibly advance the CAR control.

Multiply the key down HV and IP meter readings which will give you
the final amplifier's DC input power. The 830's normal CW DC input
power is 180 watts. Do this on all bands, calculating the input power
on all bands. This will give you an indication whether there is a
problem with the final amplifier or not.

You might also try a different watt meter and compare it with the
Bird watt meter.

22091. BS8/BS5 module xtal change

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-16 06:45:36 UTC
From: Frank VK5MFW
Topic: 22091 Message: 22091

Howdy group,
Has anyone changed the Oscillator xtal in a BS8 from the supplied 8.83mhz to 3.395 Mhz to in essance make it a BS5 and make it work with a 520 series?? All the circuit appears to be the same,, of course it would be after the 455Khz filter,, the only differance that may effect the operation of the xtal change would be the bandwitdh of T201. any comments please..cheers Frank VK5KV..

22092. RE: [TS-520_820_530_830] Re: TS-830S Gold power output

Yahoo group: TS-520_820_530_830 (2009)

One other thing I can throw in here is that if your HV caps are good you should see around 850V no load. It will dip under full key down conditions with goo finals to about 750V at full output. One good indication is that you should see maximum power output 100-120W (depending on the band) with about 220-230ma of plate current. If you load beyond 230ma you should see a Drop in output.

FYi,

Greg
KG6YV

To: TS-520_820_530_830@yahoogroups.com
Subject: [TS-520_820_530_830] Re: TS-830S Gold power output

Just a thought.

Tune the 830 up using normal tune up procedures, 830 connected to
a dummy load. Switch to CW mode, close the CW key, and note the
HV and IP meter readings. You may have to tweat the tune up
adjustments in CW mode and possibly advance the CAR control.

Multiply the key down HV and IP meter readings which will give you
the final amplifier's DC input power. The 830's normal CW DC input
power is 180 watts. Do this on all bands, calculating the input power
on all bands. This will give you an indication whether there is a
problem with the final amplifier or not.

You might also try a different watt meter and compare it with the
Bird watt meter.

If you guys keep this up I'll be pretty well informed on the TS-830S
before long! hihi

Seriously, thanks for the information and tips.

It's very cool that you take your hard-earned experience from working
with these rigs and share it.

It does not go unappreciated.

And, it will be put to good use.

I agree with Greg. This is a common misconception by inexperienced operators that believe a higher IP current results in higher output that makes a difference at the receiving end. Unfortunately, that is completely false!

What this actually does is put unnecessary/undue stress on the HV power supply AND undue stress on the final tube resulting in shorting the final tube's life span.

22096. TS-830s ALC Peak Drive Tune Up Question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-16 17:03:17 UTC
From: Peter
Topic: 22096 Message: 22096

I have a TS-830s that I bought recently and I am trying to learn how to use it correctly. I have replaced the 12BY7A tube with an NOS GE. The final tubes are 6146A's which I am not thrilled with. Other than those known things the radio otherwise seems in good shape. The problem I am having is that when trying to tune it, (step 5 on manual page 18) as instructed, I have the mode set to tune and the meter to ALC and I try to peak the drive. I get almost no activity on the meter it never goes above 1/4 scale and hardly moves if at all. I have tried to adjust the carrier control to see if this effects it, but no luck. Also in the last step of the tune, in CW, the Load control has very little or no effect. Anyone have any ideas? I have the correct 6146B NOS tubes, but don't have the tools or technical knowledge to align it. Thanks, Peter.

Hi Peter,
Here's a site (Ken K4EAA) where you can get authoritative information about your hybrid, including his instructions on how to tune them. (I have a couple of 830's and they remain my favorite rigs.)

http://www.k4eaa.com/types.html

Best regards and good luck with the 830.

Hello Peter,

There are 2 possible sources of your problem.

1. Weak final tubes

or

2. R5 and/or R6 on the Rectifier Unit have increased in resistance.

The normal final tubes used in the 830 are 6146Bs. I recommend
replacing bothj final tubes with 6146Bs then neutralize the final
amplifier. The neutralizing procedures are contained in the
TS-830 operator's manual.

If, after replacing the final tubes and neutralizing the final
amplifier the problem still exist, replace both R5 and R6 on the
Rectifier Unit. R5 and R6 are both 56K 1/2 watt resistors.

22100. Re: TS-830s ALC Peak Drive Tune Up Question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-17 18:24:04 UTC
From: Peter
Topic: 22096 Message: 22100

Bill & Mike, Thanks for your responses. I have spoken (emailed) with Ken and he is very good. I bought many parts from him. I use his tuning guide (which matches the Kenwood manual) and in step two is where my problem lies. When I have the mode in Tune, Meter to ALC and Switch to send the meter jumps backward to near zero and with any adjustment (Carrier control etc) I have found it does not make any positive effect and I am not able to peak the meter or get it to move in a positive direction at all. If I skip this step, the other steps do seem to work. So far, I have replaced the final capacitors with one of Ken's kits and have also replaced the power capacitors with one of Ken's kits. I have also replaced the 12BY7A tube with a good GE NOS tube. I plan to replace the existing (wrong) 6146A final tubes in the radio with a pair of NOS 6146B's that I just bought. I will check the other components as suggested. Any ideas welcome. Thanks again, Peter.

Hi Frank,
I have a BS 5 in excellent condition which I would happily swap for a BS 8 if you are interested. You can contact me off list at "zl1dt (at) kinect.co.nz
Cheers

By the way here Guy's I'm talking about the BS5/BS8 modules fittd to a SM220, i might just go ahead and try the xtal change a see what happens..

All the circuit appears to be the same,, of course it would be after the 455Khz filter,, the only differance that may effect the operation of the xtal change would be the bandwitdh of T201. any comments please..cheers Frank VK5KV..

22102. Homebrew SM-220 Two-Tone Cable

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-17 22:38:25 UTC
From: unnorml
Topic: 22102 Message: 22102

Greetings all,

This Group has been great for resolving my previous problems.
I was hoping someone has constructed a Two-Tone cable for the SM-220 Station Monitor. I recently acquired a SM220 with the BS-5, for use with my recently acquired TS-520S, with out any cables.
I've made one from a mono phone cord, cut 1 end and attached to the microphone inputs (pins 1 & 4, 2 & 3 being the relay inputs) on a 4 pin mic plug. To my disappointment I can't seem to get the signal through for monitoring the single tone and two-tone modulation inputs. I am also wondering if I'm going through he process entirely wrong to begin with.
Following the manual, results in no tones. Also - should the tones just come through without the relay being energized or does the send switch come into play with this. I can't seem to figure this one out.

Any and all input would be greatly appreciated.

73,

Michael - KI4FDH

Michael,

First, I'll assume that your HB two-tone cable is wired with the center conductor to pin 1 and the shield to pin 4. You are correct, pin 2 is PTT and pin 3 is ground.

Since the two-tone oscillator is used to test the transmitter's output RF signal it is necessary to key the transmitter for the test. Think of the two-tone oscillator as a person who is continuously whistling into a microphone connected to a transmitter. If you don't key the transmitter PTT there will be no RF signal generated.

You were on the right track when you asked about the send switch. You could use that to put the rig into transmit for the test. Another option is using VOX. A third option, my preference, is to add a PTT switch to that HB cable you made. If you attach a push button switch to a convenient length of shielded cable (center conductor to mic pin 2, shield to mic pin 3) you can hold it one hand and press the button while making adjustments. This approach is faster than the other methods and doesn't lock the rig into transmit mode.

73,

Ken, WA2LBI

Thanks for the response Ken,

Yes, I wired the HB cable as you had inquired.
Have been using the Send switch as well to get the tone through the transceiver. Still no tone, any ideas on what I may be doing wrong?

On a second subject, I modified the TS-520S (added the RG-174/U from the NB board to octal plug) to get the Pan Display going. My center mark moves with the rotation of the transceivers tuning knob and the background is stationary (hope I described this right), is this the intended operation?
As opposed to my center mark staying stationary and the background shifting as I tune. Otherwise I end up adjusting the Center Frequency Adjustment anytime I tune from that initial frequency.
Let me know if I to further describe this in order to make sense.

22105. Pilot lamps for Golddust Twins (599 radios)

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-18 02:53:26 UTC
From: jim_ag3y
Topic: 22105 Message: 22105

I have a set of the Golddust twins, (R-599 and T-599) and the pilot lamps have completely burned out in the receiver, and are almost gone in the transmitter.

The lamps are rated at 12 volts, and I believe 22 mA and look EXACTLY like the older style "LittleFuses"(tm)

I went to the auto parts store the other day, thinking that they would be readily available in some sort of bubble pack on the display shelves. WRONG !

Does anybody have a source for these lamps, or am I going to have to come up with some sort of miniature Christmas tree bulb modification ?

Any reply will be greatly appreciated.

Thanks in advance! 73, Jim

I assume you were unable to confirm with K4EAA they are the same as in some of the other Kenwood hybrids?

I just bought a 4-pack of those. They are 12 volt lamps. The bulbs are about 1/8" in diameter and 3/8" long, plus the leads of course.

Hope this helps.

Michael,

Let's back up a bit and run a test to verify that the two-tone generator is actually producing tones. Set up the SM-220 for use as an o'scope per the manual. Connect the two-tone generator output to the vertical input. Switch the two-tone generator from OFF to 1000 Hz to 1575 Hz and then to TWO TONE. Do you see output in all three positions?

Do you have the service manual for the SM-220? If not, I can e-mail it to you.

Regarding your second question, it has been years since I had a SM-220 in the shack so I can't look at it to verify your observations. I'm sure there are others "listening" who have them on line and can provide first-hand reports.

22108. vfo 520s against vfo 820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-18 15:15:55 UTC
From: bornofthehorses
Topic: 22108 Message: 22108

Ok I have both the vfo 520s and the vfo 820 using the 520s cable for both on a TS 520s. Which is better and why, because to save me I can not tell any differents in the receive mode anyway (getting ready to test out in 3 weeks). So QST is a no no for now, just want any and alls input on the 2. The 1 that wins will live in the station the other will be available to a good home. Also whats the water like in the way of transmatch/antenna turners? All help welcome.
Ken
call_____ soon to be I hope

These lamps do not have leads. As mentioned, they are EXACTLY like the old "LittleFuse" and clip into the same kind of holders that you would find those fuses, consisting of two small spring clips mounted on an plastic bar shaped piece . Where did you purchase your package, Mouser ?

73, and thanks for any additional info.

have you confirmed that the tone output of the scope is actually working???

try it on a sound card???

have you verified that the audio lead is on the correct pin of the mike
jack, or the line in for phone patch leads (which are you using, i forgot if
you said)

Jim:
They're called "Fuse" type lamps. Parts Express has them in 6, 8, and 12 volt versions. They were the lamp rage back in the 70's for panel and dial lighting. Many 70's hi-fi stuff also used them.
Click the link. Watch for wrap around.
http://www.parts-express.com/wizards/searchResults.cfm?srchExt=CAT&srchCat=287&CFID=13800677&CFTOKEN=49677502

Or just go to Parts Express,
http://www.parts-express.com/home.cfm
and Search for Fuse Lamps.

Sorry, what I have is a different lamp entirely.

It's the PL-4 from K4EAA's web page.

These lamps do not have leads. As mentioned, they are EXACTLY like the old "LittleFuse" and clip into the same kind of holders that you would find those fuses, consisting of two small spring clips mounted on an plastic bar shaped piece . Where did you purchase your package, Mouser ?

73, and thanks for any additional info.

I assume you were unable to confirm with K4EAA they are the same as in
some of the other Kenwood hybrids?

I just bought a 4-pack of those. They are 12 volt lamps. The bulbs are
about 1/8" in diameter and 3/8" long, plus the leads of course.

Hope this helps.

Ken,

Other than cosmetic and physical case difference, both VFO-520
and VFO-820 are the same. As you have found out, the VFO-820 will
plug into and work just fine with a TS-520 and vice verse with
the VFO-520.

Having said that, the VFO-520 and the VFO-820 will NOT plug into
nor will they work with the TS-530 and TS-830 series transceivers.
In addition, the VFO-230 and the VFO-240 will not plug into nor
will they work with the TS-520 and TS-820 transceivers.

There are a variety of tuners available on the market today.
Manual, automatic, desktop or remote mounting, as well as
unbalanced or balanced output. It all depends on your situation
and desires/needs. Don't discount older tuners from Johnson,
Drake, and others. They produce the same results as tuner sold
today.

I have owned many tuners over the years. Drake MN-200/2000's are excellent, so are Dentron's. Even the Heathkit SA2040 and 2060 will match just about anything on 80-10M. IF you desire to keep the "Kenwood" look, the AT230 is a good tuner too.

22117. DG-5

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-19 00:49:09 UTC
From: Bob Singer
Topic: 20533 Message: 22117

Anyone have any experience with the DG-5? I have one that when I got it, just randomly counted. I have the manual and schematic for it. I googled it and found some common problems. I went through it and soldered wires through all the solder through holes (82 of them), cleaned the board, cleaned the rca jacks and put it back together. Only got one segment on each number plus the dot. Pulled the display off again and used emery cloth on the display pins and put it back together. This time, I got all the digits but here is what it is doing. In the 14mhz range, it reads correctly to 14.099 then it goes to 18.100 up thru .399 (that's 14.399 actual) then it goes to 18.000. On 7.000mhz, it reads 3.000 and counts up until it gets to 3.399 (7.399 actual) and then goes back to 3.000. On 3.5mhz range, it starts out at 3.000 then at 3.100, it jumps to 3.200 and at 3.399, it jumps to 3.880. I have also taken out the screws on the board and cleaned the ground points and reassembled it. Any body seen this before and found a fix?

Thanks.
Bob

Oh, let me add one other thing. The cables that connect the DG-5 to my TS-520S are single, thin cables that are shielded with a very thin diameter center conductor. Are they adequate?

I thing I do see is the 520s has a 100 to 600 coverage and the 820 does not, it goes from 100 to 500 but you get it broke down better with the insert breaking down that stream into 10ths on the crank. As for the tuners I have been on ebay trying AND KEEP LOSING to get a few Drakes and a Johnson that showed up. I did secure a MFJ-949c any good or did I waste some money?

22120. Help: TS530-S No Power Output

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-19 02:20:14 UTC
From: j.athon
Topic: 22120 Message: 22120

Hello All,

I recentley purchased a TS530-S, assured it was working perfectly !
The receiver performs fine on all Bands. However the plastic insulator connecting the band swich in the PA section is broken, so I assume that the rig has been set to transmit with a mis match between the selected band and the Band swith position in the P.A. I don't know if this could cause damage or not.
The HV is reading Ok at 800v. I have good ALC reading with adjustment of the drive control in transmit, good Bias Current at 60mA, and 100mA of IP in the Tune/ Send mode. However, the Load and Plate controls do not have any effect, and there is no power output at all. I have tried matching the selected band with the coirrect setting in the PA bandswitch, no effect. I can hear a carrier on an adjacent receiver, but I assume this is just from the Driver section signal only.
Additional info: It is obvious that the rig has been dropped. There are severe impact marks on the outer case, the main tuning shaft is badly bent, and the feet on the bottom are also impact damaged.
I have tried replacing the Driver tube to no effect. The PA tubes do glow with plate current applied.I have no other PA tubed to try in case they are bad. How can you test them?

Any suggestions on where to start would be appreciated, as I would love to get this fine old rig running again.Used to own a TS520 and an
830S.

Thanksinadvance

Steve

From: Lou Blasco
Topic: 22120 Message: 22121

Hi Steve,

I would start with the VFO. If the main shaft is badly bent I think I'd be looking to see if I can repair that first. A VFO that doesn't tune smoothly is a real pain on these sets. Does it receive ok on all bands? I think if you can get it to RX well on bands you have at least a fighting chance that most of the set is working. A dropped radio could have plenty of other problems and remain intermittent forever. Depending on the amount of physical damage you might want to consider using it as a parts radio.

best of luck

Lou

I see what you meant by "wrap around". You were referring to the 3rd line in the URL!
Gotcha !

I will order those lamps tomorrow. They certainly are inexpensive enough, but I will have to see
what S & H are going to run me. I might purchas a Wahl cordless soldering iron. I haven't had
one of those for a LONG time !

Thanks for the link ! 73, Jim

Subject: Re: [TS-520_820_530_830] Pilot lamps for Golddust Twins (599radios)

Jim:
They're called "Fuse" type lamps. Parts Express has them in 6, 8, and 12
volt versions. They were the lamp rage back in the 70's for panel and
dial lighting. Many 70's hi-fi stuff also used them.
Click the link. Watch for wrap around.
http://www.parts-express.com/wizards/searchResults.cfm?srchExt=CAT&srchCa
t=287&CFID=13800677&CFTOKEN=49677502

Or just go to Parts Express,
http://www.parts-express.com/home.cfm
and Search for Fuse Lamps.

The MFJ949 will work pretty well with the TS-520 and friends. I don't entirely understand what you're asking about the capacitors. The 949 will arc across if you're trying to match an extremely too short aerial on 80m, so do try to avoid doing that. The TS-520 doesn't put out any higher voltage than any other 100W radio - 100W into 50 ohms is how many volts? Come on, without looking it up, it's on the exam ;-)

It's also worth bearing in mind that if your aerial is approximately right (say a half-wave dipole or quarter-wave vertical - anything resonant with about 50 ohms impedance) then the TS-520 and friends will probably match it anyway. That pi network you need to tune up with the PLATE and LOAD controls is really just an ATU.

Ken,

All VFO sub and main dials start at zero, not 100. If the sub dial on
your 520 transceiver OR remote VFO-520 will not tune down to zero,
that is a mechanical dial alignment issue not a compatibility issue.

Hello Ken and others,

The Drake low power tuner is an MN-4 not an MN-200. The MN-4 has
a maximum power rating of 200 watts. The MN-2000 has a maximum
power rating of 2KW. I have both of the Drake tuners in my shack.

The MFJ-949C tuner has a maximum power rating of 300 watts
which is well within the PEP output of a TS-520.

The Drake MN-4, MN-2000, or MFJ-939C, will work fine with a TS-520.
I do not recommend using a tuner with a maximum power rating that
is less than 200 watts with any 100 watt exciter. Always consider a
safety margin when selecting tuners.

As for replacing any of the capacitors in the MFJ-949C tuner,
unless there is evidence of damage to any of the capacitors, I do
NOT recommend changing any of them. If there "is" damage to one
or more capacitors, contact MFJ for replacement parts. Installing
a replacement capacitors with the wrong rating can result in
damage to the new capacitor as well as possibly other components.

The cap replacement I was talking about are in the 949c in the e the voltage on the caps is higher. Some of the resistors are higher wattage also, it looks like they are in the dummy load section. That would be 70.71067811865475 Volts e=SQRT P*R I always keep my Edmund ohms law cardboard spin wheel handy. As for wave cut I have 4 ac Sq 2 on 2 frontage so I can RRRRUNN wire at just about any wave %, plus I have nothing but desert on all 4 sides so if I need to go over all is well.Thanks keep it coming oh did I pass?

Ok thanks sounds like a plan I have no need to go past 300 watts any time soon anyway if and when that comes I WILL JUST BID HARDER for a Johnson or Drake next time one shows up. As for getting the dummy beefed up on the 949c I just found a design in an old ARRL Handbook for a 1000w Cantenna that should do the trick. Now if I can just find a cw filter YG-3395c for the TS-520s or and out board box to do the trick I would be set for the most part.

Ken

Sorry lol brain gas moment for some reason yes 0 to 500 for the vfo 820
 and 0 to 600 on the vfo 520s. Not a compatibility issue but it was more of a request on the advantages of one over the other.

Ken,

All VFO sub and main dials start at zero, not 100. If the sub dial on
your 520 transceiver OR remote VFO-520 will not tune down to zero,
that is a mechanical dial alignment issue not a compatibility issue.

Ken-

I have a Yaesu FT-1000MP and a Kenwood TS-520S. Although the Yaesu is clearly a better radio, I like the Kenwood best for lots of reasons, not the least of which is that I feel like I'm operating a real radio not some appliance that will speak to me.

Anyway, I'm a purist and would never tie a VFO 820 to my TS-520S. I have a VFO 520S which is what Kenwood intended and I would recommend the same to you.

As for the tuner, there is only one choice, an AT-200. It's a good tuner and matches the 520S. I wish I had one - anybody out there looking to sell?

To complete my Kenwood station I also have a SP-520 speaker, a DG-5 Digital Display and a MC-50 microphone. What a nice little station!!!

Good luck to you with your license,

-Dick-

Ken,

INRAD sells a 400Hz CW filter for the 520 for $115 plus shipping.
The filter is slightly larger than the original Kenwood filter.
I have installed this filter in a TS-520SE, same filter for the
520S. It does a great job. Installation requires cutting short
lengths of RG-174 (provided with the filter) and soldering to
the filter terminals and the 520's IF UNIT board. The filter
is mounted to the IF UNIT board using double stick tape also
provided with the filter.

See INRAD's website for further details.

No problem. There are no advantages of one over the other except
for appearance.

From: w5rkl
Topic: 22108 Message: 22133

One additional comment Ken.

A CW filter from a TS-820/820s will not work in either of the 520
series transceivers. The reason is the IF frequency of the 820
series is different than the IF frequency in the 520 series.
The IF frequency in the 520 series is 3.395Mhz where the IF
frequency in the 820 series is 8.83Mhz.

Just in case you might be thinking of using an 820 filter you
may have laying around the shack's junk box.

If you hurry over to R&L Electronics...
They have a YG-3395 listed on the used page for $69.00.
I don't think it will be there much longer. ;-))

Ok thanks sounds like a plan I have no need to go past 300 watts any time soon anyway if and when that comes I WILL JUST BID HARDER for a Johnson or Drake next time one shows up. As for getting the dummy beefed up on the 949c I just found a design in an old ARRL Handbook for a 1000w Cantenna that should do the trick. Now if I can just find a cw filter YG-3395c for the TS-520s or and out board box to do the trick I would be set for the most part.

Ken-

I have a Yaesu FT-1000MP and a Kenwood TS-520S. Although the Yaesu is clearly a better radio, I like the Kenwood best for lots of reasons, not the least of which is that I feel like I'm operating a real radio not some appliance that will speak to me.

Anyway, I'm a purist and would never tie a VFO 820 to my TS-520S. I have a VFO 520S which is what Kenwood intended and I would recommend the same to you.

As for the tuner, there is only one choice, an AT-200. It's a good tuner and matches the 520S. I wish I had one - anybody out there looking to sell?

To complete my Kenwood station I also have a SP-520 speaker, a DG-5 Digital Display and a MC-50 microphone. What a nice little station!!!

Good luck to you with your license,

-Dick-

Ken,

INRAD sells a 400Hz CW filter for the 520 for $115 plus shipping.
The filter is slightly larger than the original Kenwood filter.
I have installed this filter in a TS-520SE, same filter for the
520S. It does a great job. Installation requires cutting short
lengths of RG-174 (provided with the filter) and soldering to
the filter terminals and the 520's IF UNIT board. The filter
is mounted to the IF UNIT board using double stick tape also
provided with the filter.

See INRAD's website for further details.

One additional comment Ken.

A CW filter from a TS-820/820s will not work in either of the 520
series transceivers. The reason is the IF frequency of the 820
series is different than the IF frequency in the 520 series.
The IF frequency in the 520 series is 3.395Mhz where the IF
frequency in the 820 series is 8.83Mhz.

Just in case you might be thinking of using an 820 filter you
may have laying around the shack's junk box.

Hi Gang... I recently aquired the "Twins" from sk. I use mostly on CW. Nice strong 125 watts out on 20m into my A3S yagi. And what a conversation piece! Anyway, mic is fine, also tried audio gen, nothing. AM carrier ok and cw fine, just no audio from mic jack. Relay switches to tx fine to. Initial inspection showed no loose or broken wires or burnt components where audio from front jack goes to board. I have schematic and have some test equip, but was hoping some one may have had similar condition and point me in right direction instead of me spending hours on it starting from scratch. I sent an email with attatched pic. Thanks for reading ... W1SNE, Al in Rhode Island.

>

Al, do you have either a signal tracer, or an oscilloscope ? I would simply start at the mic input, and work my way further into the transmitter. You should hear the signal getting louder and louder, until you come to a point where it suddenly stops. I would guess that you have a coupling capacitor that is either open, or has changed to some very small value. You could also have a dead transistor or tube, where there would be a signal at the input, but it would not be present at the output. It is not that difficult to trace the audio path from mic socket to modulator, and I betcha you will find where it quits rather easily.

Good luck, and keep us posted. I have the golddust twins, too, and the complete service manuals and schematics for both units. Let us know how far you get before the audio quits, and we can probably figure it out rather quickly.

73, and good luck ! Jim AG3Y

Before ripping into the circuitry, check this:
On the bottom of the cabinet, near the front and directly in line with the mike jack, is a recessed hole with a switch protruding from it. The switch sets the high or low impedance, depending on your mike. If the switch is set to the wrong position, in-between positions, or if the switch contacts are dirty, generally the mike won't work or will work poorly. Giggle the switch and try it in both positions if you're not sure of your mike impedance. Using headphones, you can monitor yourself with the R-599D receiver for the best audio quality and audio drive depending on the switch position and the type of mike you are using.

From: ke8bg
Topic: 22146 Message: 22146

Hi all,

I finally to my TS-520 apart to try and fix my RIT/VFO instability.
I had read somewhere about the relay contacts needing cleaned to fix
numerous problems.
It took me a while to find the relay.
I was surprised to find that the contacts were good (low ohm) but they
pins on the relay were really tarnished.
I see the same kind of tarnish oxidation on old TI TTL chips from the
late 70's and early 80's where the pins turn black and won't make a good
connection if they are in sockets..
After cleaned the pins of the relay.. The radio is back to normal.. No
frequency jump..

I still have to recap this radio but its at least operational..

Just thought I would pass this along..

Duane / KE8BG

22148. 830 intermittent/fluctuating on 80, also microphone setting suggestion request

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-23 19:58:34 UTC
From: kg4kri
Topic: 22148 Message: 22148

Hello all,
I have noticed a problem with my 830- when transmitting on 80 meters, the plate current and rf output fluctuate wildly. This occurs in cw and ssb mode. This may be the alc bandswitch problem referred to in the 830 survival guide. Opinions, suggestions or cures are appreciated. The survival guide suggests using conductive paint to fix the problem- where can I find conductive paint?
On a different topic, I would like suggestions about the best mic gain and processor settings using the mc 50 mic with the 830.

Thanks and 73,
Daniel

22149. Re: Help: TS530-S -No Output on 18 and 24 Mhz-Otherwise all OK!

Yahoo group: TS-520_820_530_830 (2009)

From: j.athon
Topic: 22120 Message: 22149

Hi Lou,

Thanks for the reply. I now have full Power on all bands except for 18 and 24 Mhz which seems a bit of a coincidence. Any ideas on that one ?

Date: 2009-08-23 20:45:51 UTC
From: j.athon
Topic: 22150 Message: 22150

Hello All,

I have full Tx output on all bands except for 18 and 24Mhz? I have no drive at all on these...any suggestions?

Also , I cannot get more than 150mA IP and about 50 Watts out until after 30minutes of warm up...then I can get 250mA and full power (Except for 18 and 24 as stated above)? What could this be?

Dan I would be very careful with any kind of a mod if the AT-230 is in decent shape. These are becoming difficult to find in good condition and are bringing pretty good prices. Any mod could make it worth less as time goes on.

I'd use a flashlight :)

22154. TS-830s No RF out in Tune mode

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-23 22:39:47 UTC
From: jmcgsd
Topic: 22154 Message: 22154

I just picked up an 830s that seems to work fine except for Tune mode. When I try to tune it, the driver works fine and I can peak it in the ALC position, but then when I switch to IP to dip the plate (or RF to peak it) I get nothing. In CW mode it works OK and power seems right.

Any ideas?

Thanks

Joe,

Check the resistors R 15 and R 16 on the Rectifier Board
They should both be 56K

Topic: 22150 Message: 22162

Hi Steve. Sounds like the W.A.R.C. mod has not been done. When the TS-530S came from the factory, U.S. Amateurs were not allowed to transmit on these bands yet. There is a mod in the manual to enable transmit on 18Mhz and 24Mhz.

Oddly enough, when I got my TS-530S (used) the W.A.R.C. mod had not been done either. I did the mod of course. The odd part is that I just reversed the mod, as I am selling the radio to a friend, and his MFJ-941 (No Bloody A, B, C, or D) will not work on 18Mhz. I think that the original 941 was made before the W.A.R.C. bands existed.

Gordon,

I was wondering if it is important to keep these at 1/2 watt rating,
insofar as rig protection?

I just did the same repair on one of my TS-830S (G) rigs. Turns out R15
was intermittently "open." (I was out of the metal film 1/2 watt so I
used CC 1/2 watt.)

Works FB now.

Thanks,

LDK

Yes and do NOT cut the diodes.
Cutting a single wire will enable all the WARC bands.

I always stay with the same rating that was originally in there.
In this application, you could use Carbon or Metal Film.

22167. TS-830 RF Attenuator

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-24 01:03:59 UTC
From: waterfield55
Topic: 22167 Message: 22167

Has anyone tried to make the RF attenuator variable?
I have found that at times it helps to cut down the back ground noise enough I can pull an otherwise unheard station out of the muck. At times it is enough at other times it is too much. From what I can see, looks like there is a 470 ohm resistor in line when the switch is OFF and a 56 ohm when it is on. Have to crack the case and see for sure.
Any reason why I couldn't put a pot inline with the switch so I could vary the amount of attenuation?

Bob

Heathkit did that in their SB-303 all solid state receiver. I have an SB-303 in excellent conditions but never use the RF ATTN control. Instead, I use the RF Gain control to reduce gain, provides a much more linear gain control to the RF and IF amplifiers, not to mention the accuracy of the S meter is retained.

Hello All
I have a ts-520 with absolutly no tx or rx on 15 meters all other bands are great very nice receive and transmit just nothing on 15 the crystal is there and cleaned all wafer switches and relays any help will be great thanks 73

I'm curious as to how an ATU can "not work on 18MHz". It's just a
T-match - if it can match an aerial at 14MHz and 21MHz then it should be
able to match it at 18MHz. Unless of course there's a *huge* jump in
the coil that prevents it getting in between the two bands, but that
would mean that there were certain aerials it couldn't match on other
bands.

What happens when you try loading up the aerial on 18MHz?

Gordon 2M0YEQ

22174. Re: [TS-520_820_530_830] TS-530S- No Tx on 18Mhz and 24 MHz ? Low Power until after 30m warm up ?

Topic: 22150 Message: 22174

Hi Gordon. I am not sure why it doesn't work at 18Mhz. I do notice
that there is a coil wound on a toroid that is connected between the
large tapped coil and ground. This coil is not found on later 941C
and 941D units. When the tuner in question is used on 18Mhz, this
coil gets warm at low power levels.

I think that the toroidal coil is easily saturated on 18Mhz. The coil
is original to the tuner. I cannot get a low SWR reading on 18 Mhz
even when the tuner is connected (via the Ant1 or Ant2 connectors)to a
dummy load. The tuner works fine on all other bands including 24.9Mhz.
I Have tried the tuner on a Hustler 5BTV, and an 80M dipole.

At this point it doesn't matter to my friend that the tuner will not
work on 18Mhz. He is a tech, working on upgrading to General.

TTYL

Stephen, Maybe the Xtal is dead - it happens often with Kenwood - Trio vintage gear. To be sure, find a place to check if there is RF output from the Xtak oscillator and change bands. If nothing on 15, you're in some trouble. If you have a scope, even a low frequency one, it's ok, you don't want to measure, just to check. Without a scope, build a simple RF sensor on the PC board with a germanium diode, a 2-10 pF coupling cap, a 10 k resistor and a 10 nF decoupling cap, plus your VOM, doesn't have to be digital, that's OK. Refer to the user's or service manual to find a suitable check point. Good luck & 73's - Daniel, ON5PY

It is also possible that the heterodyne oscillator coil for the 15M band is out of alignement. If someone tweeked it past the "peak" point enough it would just stop oscillating and appear to be a dead crystal....

To Kenwood TS 830 Techs...I have personally maintained my TS 830 since I purchased the transceiver in 1980..Over 300 countries worked..I now have an "unsolveable" Rectifier problem....R 11 470 ohm resister gets taken out when I try to Tune the Drive section coils in the RF section..When I throw the SG switch to off that is on the rear of the rig the Digital Display on the front of the rig goes dark, I think this indicates some sort of short???? I can not find it. I replaced the 470 ohm R-11 twice along with the relay RL-1 in the rectifier section Before I throw the SG switch I get 65 ma of Bias. After the R-11 goes south, no Bias....HELP...George Campbell W1GCC Stuart,FL

If you have a reciever or another rig that can receive on the Xtal freq, make a short coax line with a few inches of center conductor sticking out, as a probe.
with the proper connector on the other end , connect to the test reciever..
Now ...hold the probe end near the crystals with the power on and see if you cn hear the signal, try changing bnds and see if the correct frequencies show up in your 2nd receiver..

Thanks For all the help although not fixed I at first wondered If I was going to receive help but I have and must say I never had an elmer been liscensed since I was 13 years old and wow what happened to those days agian appriciate all that are helping
I did the alignment to the best of my knowledge my test lead on my VTVM is broke I do get about 15 watts of RF output on 15 meters If I place the drive above the normal 5 position closer to 10 I can get 25 watts but I notice that the meter slams to the right as soon as I return to rec position on the send switch this does not accure on other bands I did a HV reading and it is the same as all other bands which way do I look now and again thanks to all 73

Hi,

you can add a small lamp socket using either a few drops of
superglue or 5 min epoxy to attach it to the inside of the tuner,
very easy to remove it if you need to.

pass the power cable out the back panel in the lower corners
and you're good to go.

73 james ke4drn

> Dan I would be very careful with any kind of a mod if the AT-230 is in decent shape.
These are becoming difficult to find in good condition and are bringing pretty good prices.
Any mod could make it worth less as time goes on.

Subject: Re: [TS-520_820_ 530_830] Help NO TX or RX on 15 meters

Stephen, Maybe the Xtal is dead - it happens often with Kenwood - Trio vintage gear. To be sure, find a place to check if there is RF output from the Xtak oscillator and change bands. If nothing on 15, you're in some trouble. If you have a scope, even a low frequency one, it's ok, you don't want to measure, just to check. Without a scope, build a simple RF sensor on the PC board with a germanium diode, a 2-10 pF coupling cap, a 10 k resistor and a 10 nF decoupling cap, plus your VOM, doesn't have to be digital, that's OK. Refer to the user's or service manual to find a suitable check point. Good luck & 73's - Daniel, ON5PY

22187. 830 station for sale

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-25 01:19:45 UTC
From: yash@aol.com
Topic: 22187 Message: 22187

Need to make some room in the shack,so time to sell or trade the complete ts-830 station.

consisting of the following:
1. Ts-830s
2. vfo-230 digital vfo.
3. sp-230 filtered remote speaker
4. at-230 ant. tuner
all manuals,cables and desk mic..shure.
All the gear is a easy 9/10,with no operational issues,plug and play.
OPEN TO TRADES FOR HF GEAR. Main interest,Icom 746,746pro,756 pro, ft-920.or ts-480
stright trade or can add $$.

asking 850.00 split shipping.

Might consider splitting the station up. would really like to sell as a package.
thanks
dale wt4t

Check fixed cap C4 across L4 and C5 in series with C4/L4 to ground.

Just a thought.

22189. TS 830 intermittent/fluctuating on 80, also microphone setting suggestions?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-25 09:07:23 UTC
From: kg4kri
Topic: 22189 Message: 22189

Hello all,
I have noticed a problem with my 830- when transmitting on 80 meters,
the plate current and rf output fluctuate wildly. This occurs in cw and ssb mode. This may be the alc bandswitch problem referred to in the 830 survival guide. Opinions, suggestions or cures are appreciated.

The survival guide suggests using conductive paint to fix the problem- where can I find conductive paint?

On a different topic, I would like suggestions about the best mic gain and processor settings using the mc 50 mic with the 830.

Thanks and 73,
Daniel

22190. sell ts-830 complete station

Hi,

I'm Guido, LW8EOQ, from Argentina. I own a Kenwood TS-830S that works ok.

Previous owner had a problem with a hot soldering iron that fell on the front of the rig. He tried to repair it, but there's a awful dent in the upper right corner.

I'm looking for a front panel in good shape.

If you happen to have a spare one, please contact me by email.

Thank you.

73,
Guido, LW8EOQ
Argentina

Your meter probe must be detuning the circuit, try retuning this point, just using rf output reading t peak the coil.

It is also possible that the heterodyne oscillator coil for the 15M band is out of alignement. If someone tweeked it past the "peak" point enough it would just stop oscillating and appear to be a dead crystal....

George,

Yes, a 1N5399 will do fine as a replacement for D12.

I assume you either removed D12 from the circuit or pulled one leg of D12 to make your measurement.

The TS-520 adjustment step in question, page 43 step 5 "Coil pack alignment" in the service manual requires a VTVM with an "RF Probe". Using a normal DC or AC probe with a VTVM to accomplish that step will not work, the readings will be false.

Mike...Many tks for the advice...I am in the process of checking out the resisters in the rectifier board in case there other "soft" or shorted ones...Yes, I took the D12 completely out of the circuit board...measured -0- the same when the probes are reversed in the diode test position on my Sperry DM-4100 meter...I kinda wondered what caused the D-12 to break down. When I get the rectifier board put back together I will check the 14 V comming from the SGS wire from the xformer....Perhaps there might have been a spike in the voltage some where along the line to cause a breakdown with diode D12. Thanks again Mike...I will let u know if a new diode rectifies the rectifier circuit.....George WGCC...Stuart,FL

George,

Yes, a 1N5399 will do fine as a replacement for D12.

I assume you either removed D12 from the circuit or pulled one leg of D12 to make your measurement.

Just to be sure, I would use a small power rectifier from a discarded appliance, like a 1N400X, X beeing 1 to 7.

Be careful with polarity when replacing.

George,

The original D12 diode, 1S1555, is a 35VDC 300ma switching diode. It is possible a surge exceeded D12's maximum PIV rating of 30VDC at 100ma.

The 1N5399 general purpose silicon diode is more than enough to use as a replacement for D12. Naturally a 1N5399 is a bit over kill but it will work.

As previously mention, ensure the replacement diode is installed correctly, banded end lead towards the "12" terminal on the Rectifier Unit. The Rectifier Unit silk screen should indicate which lead the diode's banded lead is to be inserted.

One more comment. I noticed I didn't comment on R11, 470 ohm resistor, on the Rectifier Unit.

I suspect C181 is shorted internally. C181 is located on the IF UNIT and C181 is the filter capacitor for the 210VDC supply. If C181 is shorted internally, an excessive amount of current will flow through R11 resulting in R11 over heating and being destroyed. C181 is a 22ufd 350VDC radial lead capacitor which is available at Mouser Electronics.

Hi Stephen. If you do not have the test equipment to do the alignment procedure in the service manual, I suggest doing the procedure in the user manual. It basically only requires the correct alignment tool(s), and a DC voltmeter(and possibly a frequency counter). I would try aligning just the 15M section, as you say all other bands work fine.

TTYL and good luck!

I am looking for any and all modifications that could have been done
to a ts520s over the years.

I have one that a friend is checking out for me and he has told me that
there has been some modifications done to it that he can't figure out
what there are for. He says there are a few wires that don't make sense
to him at all...:(

Is there a comprehensive page out there that I can look at that has a
GOOD majority of the modfications that were available over the years
to this nice radio? It does receive nicely but we are not sure about the
transmit yet as I am not that good at hollow state technology.

Thanks in advance,

James W8ISS

Mike...Thanks for the follow-up on R-11 in the rectifier unit...I am impressed by ur Kenwood "savvy".Your right C-181 was shorted. I noticed that it was shorted a few weeks ago when I was tracking down the no drive problem so I replaced C-181. So now I know what knocked out R-11 in the rectifier unit...I will be replacing diode D-12 today...I will let you know the results...I hope when I throw the SG switch to off I will be able to tune the coils in the final drive section without the freq. dial shorting out....George W1GCC...Stuart,FL

Hi There,

"mods.dk" on the internet has a substantial list of modifications for the 520 series along with many other radios. The one caveat is that they have different levels of access. If you take free access you can only look at one file per 24 hr period. If you subscribe you can view/download 5 per 24 hr period.

FYI,

Greg
KG6YV

INRAD sells a very nice filter for the 520 series. I have installed their filters in both 520s and 530s. They are excellent filters.

See INRAD's filter selection at the following link for further details.

http://www.qth.com/inrad/

From: w5rkl
Topic: 22178 Message: 22212

George,

The Counter Unit was not the only circuit that failed when D12 on the Rectifier Unit shorted internally and the SG switch was set to the OFF position.

When diode D12 on the Rectifier Unit shorted internally and the SG switch was set to the OFF position, the SG switch caused a short to ground to exist across the AF UNIT's 12VDC supply. The AF UNIT's 12VDC supply is the source voltage for ALL 12VDC circuits.

The short across the 12VDC supply resulted in loss of DC power to the Counter Unit, the RF UNIT's receiver RF amplifier Q1 and amplifier/buffer Q2, almost all of the IF UNIT circuits, as well as the AF UNIT VOX relay control circuit, Q7.

The 210A supply, originating on the Rectifier Unit, failed because of a shorted C181 filter capacitor on the IF UNIT. When C181 shorted internally, C181 provided a direct short to ground on the IF UNIT plug 14 pin 2 resulting in loss of voltage from the 210A supply. The sort in the 210A supply resulted in loss of driver tube screen voltage, hence no RF output from the driver tube. A shorted C181 was also the reason R11 smoked.

One last suggestion. I would check diode D6 on the Rectifier Unit as it may have failed when C181 shorted internally. If D6 has failed and even though you have replaced C181, the driver tube screen voltage will still be missing resulting in the same no RF output symptom. Just be sure when replacing diodes to install them correctly.

22215. Re: ts-520s modifications

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-27 16:48:55 UTC
From: w5rkl
Topic: 22147 Message: 22215

I don't know what the 520 modification lists contains. However, there is one common modification that is performed with the 520 and 820 series transceivers and that is to modify both transceivers to operate on 11 meters in one or more of the 10 meter band switch settings.

This modification requires replacing one or more of the standard 520 or 820 10 meter heterodyne oscillator crystals with crystals that allow the 520 and 820 to operate on 11 meters. The 520 heterodyne oscillator crystals are located on the RF UNIT but the 820 heterodyne oscillator crystals are located in the PLL UNIT.

To determine if this modification(s) has been performed on either the 520 or 820, simply visually inspect the 10 meter heterodyne oscillator crystal frequencies stamped on the crystals themselves and compare the frequencies with the standard 10 meter crystals listed on the 520 RF UNIT schematic or the 820's PLL UNIT schematic. If the crystals are not the standard crystals, replacements can be obtained from International Crystals in Oklahoma City, Oklahoma for $22 a piece plus shipping. Alignment of 10 meters will be required once the "CB Hacker" modification has been removed.

22216. Re: TS 830 Rectifier Problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-27 17:19:30 UTC
From: w5rkl
Topic: 22178 Message: 22216

Good deal George. By the way, you do not have to turn the Heater switch ON to check for the 210A voltage. The 210A voltage is there whether the Heater switch is turned ON or not.

I recommend leaving the Heater switch OFF, after replacing D6. Measure the 210A voltage on the RF UNIT's plug 9 pin 2 and not just at the Rectifier Unit's 210A terminal. Check both terminals for the presence of the 210A voltage, start with the Rectifier Unit first since that's where the 210A voltage originates from. The 210A voltage can be present at the Rectifier Unit but not at the RF UNIT plug 9 pin 2. I've seen this happen a few times.

If the 210A voltage is present after replacing D6 on the Rectifier Unit, then turn the Heater switch ON and watch for any abnormal symptoms such as smoke, crackling, sizzling, or the fuse blows.

If everything is working properly after replacing D6, along with all the other components you replaced, I suspect the 830 will work fine now. Of course you will have to check the alignment to be sure the 830 is operating up to specifications.

Take your time, don't be in a hurry. Never assume anything, check the operation against the service and operator's manuals to be sure. Set the final amplifier's idling current as outlined in the operator's manual before attempting any alignment. If any of the tube plates turn red after the tubes warm up, turn the 830's Heater switch OFF immediately. Turning the Heater switch off, removes filament voltage from the tubes and prevents the tubes from conducting.

Tubes that show color in standby (red plates) indicates, in many but not all cases, a loss of negative grid bias voltage to the tube grids.

The negative bias voltage originates on the Rectifier Unit's "-C" supply. You can check for the presence of the -C voltage on the AF UNIT's "-C" terminal and the RF UNIT's "FG" terminal. The Final Unit's "FG" terminal voltage which is the same -C voltage, should vary as you rotate the rear panel's bias pot. This is normal.

"I was going to again take out the entire RF board (a
tedious task) and check out why no voltage from the driver tube..."

In many cases this is not necessary. Voltages can be easily measured at the plug pins using a paper clip inserted into the plug. Voltages at the tube sockets can be measured with the Heater switch turned OFF and the tube removed. Care must be taken when working around the final amplifier since the HV is constantly present on the tube plate caps when power is applied to the 830. The only way to turn the HV OFF is to remove the HV connection on the Rectifier Unit and I don't recommend doing that. Just use standard safety precautions when working around HV, or any voltage circuit(s) and you should do fine.

Mike... The following are the measurments that I just completed on the rectifier boarb...tomorrow I will turn the TS-830 over and take measurments at the socket points of the 12BY7 and let you know...all the following are measurments are from the rectifier pins to ground...

AC pin marked 100..... 90 VAC to ground
AC pin marked 210 .....191 VAC to ground
A pin marked 210.......245 VDC to ground
AC pin marked 300......250 VAC to
ground SG pin marked
-2-.......245 VDC to ground
TUNE pin.....123 VDC to ground
14 pin..... 17 VDC to ground
SG1 pin.....124 VDC to ground
400 pin marked 400....450 VDC to ground
300 pin marked B.......321 VDC to ground
PD 1 pin.....121VDC

Mike,Let me know what you think of these measurments...George

"I was going to again take out the entire RF board (a
tedious task) and check out why no voltage from the driver tube..."

In many cases this is not necessary. Voltages can be easily measured at the plug pins using a paper clip inserted into the plug. Voltages at the tube sockets can be measured with the Heater switch turned OFF and the tube removed. Care must be taken when working around the final amplifier since the HV is constantly present on the tube plate caps when power is applied to the 830. The only way to turn the HV OFF is to remove the HV connection on the Rectifier Unit and I don't recommend doing that. Just use standard safety precautions when working around HV, or any voltage circuit(s) and you should do fine.

Topic: 22178 Message: 22219

George,

I'm not sure if you have the high resolution schematic for the TS-830 or not. If not, you can download it at the following link:

http://www.n6wk.com/kenwood/TS-830S-excellent%20schematic.pdf

This is an excellent schematic to use when troubleshooting the TS-830.

You will notice that a number of wires are grouped together. The key to tracing the wires are the "labels" such as "SG1", "SG2", and "STB" etc.

The primary windings of the power transformer are grouped into 2 groups of windings, each group containing it's own group specific "0" terminal and 2 non-zero terminals.

The power transformer's primary winding groups are as follows.
All voltages are AC:

0, 100, 120
0, 100, 120

The power transformer's secondary windings are groups are as follows.
All voltages are AC:

0, 12.6
0, 14
0, 100, 210, 300
0, 400, 800

Notice that each winding group has a "0" winding. Each "0" winding is specific to that group. Therefore, when measuring AC secondary windings, the AC meter's negative lead is connected to that group's "0" terminal and the AC meter's positive lead is connected to that groups non-zero lead.

Based on the voltage measurements you provides it appears the voltages are Ok. Voltage can vary depending on the primary AC voltage level applied to the transformer's primary winding(s).

Have you checked the 830 for RF output since you have changed D6 on the Rectifier Unit?

That's what I was starting to be afraid of on 'modifications'. I was
afraid that this radio would be like what I am starting to run into with
a Yaesu FT-101ee that I had acquired at the same time. Noticed that the
Yaesu was receiving 11meters on portions of the 10 meter segments also.

That's why I put out the question about finding ANY and ALL modification
so that I could start working backwards to 'fix' them and put the radio
back into a more useful condition.

James,

Whether your FT-101EE or your TS-520 has been modified to operate on 11 meters, converting them back to 10 meters is not difficult.

Most 11 meter modifications consist of simply changing one or more of the 10 meter heterodyne oscillator crystals then peaking the heterodyne oscillator.

The 11 meter modification does not modify or change the VFOs. There is no benefit in changing the VFOs.

Most 10 meter final amplifier PI networks will tune 27Mhz with little to no modifications.

Therefore, don't worry about the modification, simply convert it back to normal 10 meters by replacing the CB Hacker's heterodyne oscillator crystals to the normal 10 meter crystals then align the heterodyne oscillator using the service manual.

The TS-520 is a "double conversion" transceiver while the TS-820 is a "single conversion" transceiver. The conversion process is "basically" the same in both transceivers. The conversion process differs between the two transceivers in that the frequency in the 520 is converted "twice" where as the frequency in the 820 is converted "once".

Mike W5rkl
 The 520 I have the crystals seem to be soldered in underneath on the band selector switch. Would the band selector switch have to be dis-assembled to take the 11 meter crystal out. Or am I looking in the wrong area.

Thanks
ki0gv
Mike

22223. TS 830 problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-28 13:06:16 UTC
From: kg4kri
Topic: 22223 Message: 22223

Hello all,
I have noticed a problem with my 830- when transmitting on 80 meters,
the plate current and rf output fluctuate wildly. This occurs in cw and ssb mode, and even into a dummy load. Any help is appreciated!

Where can I find conductive paint?

On a different topic, I would like suggestions about the best mic gain and processor settings using the mc 50 mic with the 830.

Thanks and 73,
Daniel

Mike (KI0GV),

The heterodyne oscillator crystals on all of the TS-520 series radios are soldered onto the Oscillator Coil Unit boards. The Oscillator Coil Unit board contains the oscillator band switch wafer that is also soldered to the board.

The Oscillator Coil Unit in the TS-520 has the label X40-0019-01.

The Oscillator Coil Unit in both the TS-520S and TS-520SE has the label X44-1160-00.

The Oscillator Coil Unit board should be removed from the 520. This is how I would do it. Others may have a different approach which is fine for them. I simply find it much easier to have the board on the bench in front of me. Whether you remove the Oscillator Coil Unit board or leave it in place is up to you.

Daniel,

Based on the information you have provided, the variations in RF output on 80 meters appears to be a dirty band switch wafer. Clean all of the band switch wafers and that includes the switch wafers inside the final amplifier cage, with contact cleaner. Use canned air to remove excess contact cleaner. Canned air can be found at Walmart in their television/computer department.

Read and adhere to the contact cleaner cautions/warnings written on the can since contact cleaner is very flammable and it only takes a small spark to ignite it.

As for the MIC gain and Processor settings for an MC-50 microphone, I can only recommend following the TS-830 operator manual's instructions. Everyone's voice is different and a setting that is right for one person may not be right for you.

Unfortunately, I have no idea where you can purchase conductive paint. What problem do you have that makes you believe you need to use conductive paint? If the problem is a broken/burnt PC board foil run, a wire soldered across the break can fix this type of problem.

I had an 830S with an MC50 mic for several years.

The processor on the 830S is one of the best designs ever. It provides an increase in punch with reasonably low distortion.

Set the mic gain without the processor keeping the ALC within range.
Set the processor to about 10 o'clock.
Turn on the processor and readjust the mic gain if necessary to stay within the ALC range.

It will sound punchy but very nice.

22227. How to drive a TS 830 with a SM20

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-28 15:53:32 UTC
From: m3iqq
Topic: 22227 Message: 22227

Hi,
I was wondering if anyone could help me. I have a ts830 line up (well everything except the VFO) along with the SM20 base microphone. The problem is when using the base Mic I can't drive the radio enough unless I raise my voice? I know it's not an issue with the radio as the fist mic gives wonderful audio as does the base microphone if I bring it up to my mouth.
I have tried different amplified microphones but they seem to over drive the radio and cause major distortion to the audio.

Can anyone offer any advice on the use of the SM20 or how to amplify the audio?

Many thanks
Andy

Hi Mike. Years ago I had a TS-520 that had been converted to operate on 11M. Not only had the 10M crystals been changed, but CW mode had been modified for AM voice operation. Of course I changed the crystals back to the correct 10M ones, but I was never able figure out how to undo the AM mod. I think I recently saw a mod for the TS-520 to add AM, but I am not sure where. On the TS-520 that I had, CW still worked fine as long as you disconnected the mic.

It is a shame that CB hackers have modified these fine Kenwood Amateur Radios. I can understand some of the CBers frustration with the lack of quality and and the poor receiver performance (despite extremely high prices for what you get) of pretty much all of the CB transceivers. However, I cannot condone in any way the modifying of Amateur Radio equipment for use on 11M frequencies.

As the class D CB band was only meant for local (short range) communications, I think that the FCC made a big mistake in 1976. Instead of expanding the 11M frequencies from 23 to 40, they should have moved the class D service to a high VHF frequency (somewhere around 250Mhz or higher). A grace period of 1-2 years would have allowed time for the CBers to switch. After the grace period, there should have been extremely rigorous enforcement against any CBer still using the 11M frequencies.

Instead they took the easy way out.

Andy,

The Icom SM-20 microphone has a built in amplifier that requires a DC power source, 8VDC, that is normally provided by the Icom transceiver at the microphone socket, pin 2. The TS-830 microphone socket does not provide that power source at its microphone socket.

There is an extra fixed capacitor switched across the plate tuning cap on 80M. It is near the bnd switch. Mine fried and it only affected 80M. new cap solved the trouble.

And furthermore, the Sm20 is low impedance and the 830 mic input is high impedance.

The TS-830 has a microphone audio impedance range between 500 ohms and 50,000 ohms. The Icom SM-20 microphone has an impedance of 600 ohms which is within the audio impedance range of the TS-830.

Check fixed cap C4 across L4 and C5 in series with C4/L4 to ground.

Just a thought.

22234. TS-520 Carry Handle

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-29 23:27:51 UTC
From: Allan Cridland
Topic: 22234 Message: 22234

Hi,

I am chasing a carry handle (complete) to suit a TS-520.
Would anyone have spare one they could part with?

Topic: 22234 Message: 22238

I had a similar problem with the carrying handle on my 820, the thread broke and became unraveled exposing the metal insert and padding. I used a heavy duty sewing needle and heavy duty white thread to resew the handle. I then followed with black shoe polish. It now looks great and the heavy white thread shows nicely.

Mine is bad enough that the leather is all chewed up (got it that way
wrapped in black electrical tape) so I'm going to have it remade. They
I'll put it up for sale.

22240. Re: How to drive a TS 830 with a SM20

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-30 20:06:25 UTC
From: m3iqq
Topic: 22227 Message: 22240

Hi,
I'm really sorry but i got the microphone wrong!

I have a MC 50 for the trio, the SM20 is on the 2m radio.
I've no problem with the audio when using the SM50, but i have to talk with my mouth quite close to it.

I would like to be able to key the mic then on the desk and talk normally, not have to move close up to it.

Maybe this is normal on the 830 but I dont have this problem when using a FM radio?

Sorry for the confusion

Andy
2e0bay

PS,
Has anyone got the VFO for sale?

Hi Andy. When using my MC-50 with my TS-530S (or my TS-430S, or my TS-130SE) I talk within about 4-6 inches of the mic. The connector on the back of the mic itself can be inserted 2 ways, and this is how the impedance of the mic is selected. You might try the other setting.
Are you following the instructions in the manual for setting the mic gain?

You can make a new handle from a narrow men's dress belt.
Reuse the metal insert from the old handle.

Mine is bad enough that the leather is all chewed up (got it that way
wrapped in black electrical tape) so I'm going to have it remade. They
I'll put it up for sale.

You can make a leather carry handle from a section of a men's narrow leather dress belt. Slip the metal strip inside the new handle cut from the leather belt.

22245. Re: How to drive a TS 830 with a SM20

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-08-31 04:11:39 UTC
From: w5rkl
Topic: 22227 Message: 22245

The MC-50 is a dual impedance microphone, 600 ohms or 50K ohms. Since the 830 has an impedance range from 500 ohms to 50K ohms, the MC-50 should work fine regardless how the microphone cable is connected.

I recommend checking the Processor push button on the upper left corner of the 830's front panel, directly above the Processor control. I also recommend reviewing page 19 of the 830's operator's manual for details on adjusting the Processor and MIC controls.

You might also take a few moments and review the 830's high resolution schematic, available free at the following link. This will help a lot when troubleshooting problems with the 830.

Voltages at the tube sockets can be measured with the Heater switch turned OFF and the tube removed. Care must be taken when working around the final amplifier since the HV is constantly present on the tube plate caps when power is applied to the 830. The only way to turn the HV OFF is to remove the HV connection on the Rectifier Unit and I don't recommend doing that. Just use standard safety precautions when working around HV, or any voltage circuit(s) and you should do fine.

> > >
> > > The short across the 12VDC supply resulted in loss of DC power to the Counter Unit, the RF UNIT's receiver RF amplifier Q1 and amplifier/buffer Q2, almost all of the IF UNIT circuits, as well as the AF UNIT VOX relay control circuit, Q7.
> > >
> > > The 210A supply, originating on the Rectifier Unit, failed because of a shorted C181 filter capacitor on the IF UNIT. When C181 shorted internally, C181 provided a direct short to ground on the IF UNIT plug 14 pin 2 resulting in loss of voltage from the 210A supply. The sort in the 210A supply resulted in loss of driver tube screen voltage, hence no RF output from the driver tube. A shorted C181 was also the reason R11 smoked.
> > >
> > > One last suggestion. I would check diode D6 on the Rectifier Unit as it may have failed when C181 shorted internally. If D6 has failed and even though you have replaced C181, the driver tube screen voltage will still be missing resulting in the same no RF output symptom. Just be sure when replacing diodes to install them correctly.

> Mike...I finally had a chance today to take your suggestion and measure the driver tube voltages (12by7) with a paper clip in the tube sockets as follows:

> PIN # 1 -0- SHOULD BE PER SCHEMETIC 4.6 V PROBLEM?

No. Pin 1 is the tube's cathode. In standby (receive) the cathode voltage should be "0" as the tube is "cut off". In transmit, the voltage on pin 1 should be +4.6VDC. The voltage on pin 1 reduces to zero in standby by the application of the negative voltage to the grid, pin 2. See pin 2 voltage description next.

> PIN # 2 41VDC " " " 43.6 VDC OK

"Yes" and "No." Pin 2 is the tube's grid. In standby, the voltage applied to pin 2 should be -43.6VDC. In transmit, the voltage should be a +.4VDC. "IF" both receive and transmit voltages on pin 2 are "negative" (-43.6VDC and -41VDC), the driver tube is "cut off" and that is why there is no RF drive to the final amplifier.

> PIN # 3 -0- " " " 1.4 VDC PROBLEM?

The voltage on pin 3 will be "0" in both transmit and receive. Pin 3 is the tube's suppressor grid (screen) and it is grounded.

> PIN # 4 -0- " " " ?
> PIN # 5 12.5VAC " " " 12.5VAC OK

Pin 4 and 5 are the tube's filaments. Pin 4 is ground so it will measure zero VAC. Pin 5 is connected to the ungrounded 12VAC secondary winding on the power transformer and will measure 12VAC. No problems noted here.

> PIN # 6 -0- " " -0- OK

"Yes" and "No". Pin 6 is the tube's cathode. In standby (receive), the voltage is zero because the tube is "cut off". In transmit, however, the cathode voltage should be a positive "4.6VDC". If the voltage is "0" in both transmit and receive, there is a problem. If the voltage on pin 6 is "0" in both receive and transmit, that, again, indicates the tube is "cut off", not conducting.

> PIN # 7 325 VDC " " " 339VDC OK

No, pin 7 is the plate. In receive (standby) the plate voltage should be 339VDC, tube is cut off so no current is flowing. In transmit, the tube is conducting and the plate voltage should reduce to 297VDC. The tube is not conducting.

> PIN # 8 235 VDC " " " 241VDC OK

No, pin 8 is the tube's screen. In receive, the tube is cut off and therefore the screen voltage should be 241VDC. In transmit, the tube is conducting and the screen voltage will drop to 185VDC. Your measurement indicate the tube is not conducting.

> PIN # 9 -0- " " " ? PROBLEM?

No problem. Pin 9 is connected to the tube's suppressor grid screen the same as pin 3, hence, pin 9 is grounded through the tube's suppressor grid to pin 3 resulting in "0VDC".

>
> PLENTY OF BIAS MIKE...HOWEVER STILL NO DRIVE....ANY MORE THOUGHTS?

That good as some problems affect the bias voltage. That doesn't appear to be a problem with your 830's bias supply. I must ask, have you set the final amplifier's idling current to 60ma yet? If not, follow the operator's manual steps and set the bias for 60ma idling current.

When using the 830 high resolution schematic, the voltages in RED have, in some cases, 2 voltages. Where 2 voltages are provided, one in parens and one not in parens, at a specific connection, pin, or tube socket pin, the non-paren voltage is the "standby" (receive) voltage and the voltage in parens is the transmit voltage. It's important to understand this since performing voltage checks can make a difference as to whether the circuit is working properly, only working so-so, a component is shorted, or the circuit is not workign at all.

Recheck the voltages and compare them with the high resolution "RED" voltages around the driver tube.

George,

I should have included this comment in my last response.

I assume you made the voltage measurements with the driver tube in its socket. If the driver tube was not in its socket then the voltage measurements are incomplete.

To properly measure the voltages the driver tube must be in its socket and all voltages applied. As I mentioned in my last response, the high resolution 830 schematic shows, in many areas, 2 voltages at a particular connection/tube socket terminal. The voltage NOT in parens are the receiver or standby voltages. The voltages that ARE in the parens, are the transmit voltages.

>

This is incorrect. My editing of pin 6 information is wrong. I cut and pasted incorrect information.

The driver tube Pin 6 is NOT used in the 830. Pin 6 is the center tap of the filament inside the 12BY7. This allows the 12BY7 to be powered from a either a 6VAC or 12VAC filament supply. When 6VAC is used to power the 12BY7, pins 4 and 5 are grounded and 6VAC is applied to pin 6. The only pins used to power the filaments in the 830's 12BY7 are pins 4 and 5. Pin 6 is not used and is not connected to anything outside of the tube.

I appologize for the error.

Mike Thanks for all the voltage updates...1ST... All the measurements I sent to you were made in the receive position with the power&heater switches on and the 12BY7 not in the socket...I did not make any measurements in the transmit position
2ND I will re-measure all the voltages as you recomended with the 12BY7 in the socket..I have jury rigged a paper clip to attach the base of the paper clip to each suceeding pin to be measured while the 12BY7 is in the socket.I will let you know the results.
3RD....I do have the high resolution schematic with the red voltages indicated at the tube connections. the schematic is in the service manual....4TH...I do have the 830's final amps idling current set at 60 ma I am working on the measurments now with the mode switch set in the "tune" position....I have noted ur comment on pin 6....George W1GCC.

If the voltage is "0" in both transmit and receive, there is a problem. If the voltage on pin 6 is "0" in both receive and transmit, that, again, indicates the tube is "cut off", not conducting.
>

This is incorrect. My editing of pin 6 information is wrong. I cut and pasted incorrect information.

The driver tube Pin 6 is NOT used in the 830. Pin 6 is the center tap of the filament inside the 12BY7. This allows the 12BY7 to be powered from a either a 6VAC or 12VAC filament supply. When 6VAC is used to power the 12BY7, pins 4 and 5 are grounded and 6VAC is applied to pin 6. The only pins used to power the filaments in the 830's 12BY7 are pins 4 and 5. Pin 6 is not used and is not connected to anything outside of the tube.

I appologize for the error.

Hello George,

OK, will wait for the voltage readings with the driver tube in its socket.

If you could, use 2 voltage columns, one for receive and one for transmit for each pin.

I'm more concerned about the driver tube's grid voltage since it affects the driver tube's cathode, plate and screen voltages. If the driver tube is being held at cut off in transmit due to a failure elsewhere, then there will be very little, if any, change in the driver tube's cathode, plate, and screen voltages. A driver tube that is held at cut off in transmit will fail to produce RF output which leads to zero ALC or RF output indication in TUNE mode regardless of the CAR and DRIVE control settings. The final tube's idling current will remain rather constant at 60ma, no increase in IP current since there is no RF from the driver tube being fed to the grids of the final tubes.

I had a new handle made for my TS-520S at a local boot shop. He did an outstanding job. I took him my old handle and the steel insert from the handle (I had taken it apart). He put the steel insert in it and punched the correct length slots in the leather and sewed it together...very professional. I put a picture of it in the photo section along with the name, address and phone number of the Boot shop. It was cheaper to have this made than it was to buy one from a guy in Colorado who had one for sale. With this installed, I am selling the radio. It is a Kenwood TS-520S in very nice condition both physically and electronically. I actually have not transmitted on it because when I got it, I didn't have my General ticket yet but the man I got it from had it running when I got there and made several contacts with it while I was there. It will come with the radio, A/C power cord, a very nice Kenwood MC-50 mic and a Kenwood DG-5 that reads 2mhz high. I am getting rid of it because I bought an Icom IC-706MKIIG and don't need two HF radios. I want $350 for it all plus shipping. Picture in the photo section also under Kenwood TS-520S

From: blacklabpupp
Topic: 22256 Message: 22256

This has puzzled me for some time. On the Plate tuning knob, the bands are marked with large white spaces that seem easy enough to read on the higher bands. But where do you start on 80 meters. The 3.5 is in the middle of the white portion of the dial, and 40 meters is connected to it. So if I am loading up on 3.581, do I put the pointer on the 3.5 or on the bottom of the white portion? I have loaded it up in several places and it worked, but I am not sure of where it really goes. I never use 80/75, I hardly ever leave 20 and it is dead for now. But tell me where you guys set the pointer, cause it sure beats me where to start. Gene

You're not really "running" the PA valves at 60mA, that's the quiescent current. When you're actually amplifying some stuff through them the anode current may be over 200mA, as indicated on the meter.

The reason you set them to 60mA at "idle" is to bias them into their linear portion. The valve doesn't have a perfectly linear relationship between the voltage on the grid and the current through the anode, so (just as with a transistor amplifier) a bit of bias shoves it up onto the flat bit.

Gordon 2M0YEQ

22260. Re: Plate Current

Yahoo group: TS-520_820_530_830 (2009)

From: w5rkl
Topic: 22258 Message: 22260

Is the 60ma mandatory? Yes, if the amplifier is to remain operating in its normal AB1 class.

Tubes amplify by a positive and negative "swing" in grid voltage from the driving signal. The normal fix grid bias (set by the bias pot in all hybrids) does not, in itself, change, but by applying the RF sine wave to the grid of the final tube, the grid swings positive and negative. As the swing occurs, a swing up and down in plate current also takes place in the tube.

If the bias voltage is incorrectly set, the positive and negative swing in the grid can result in the swing in plate current in the tube to be in a non-linear portion of the tube's plate curve which results in distortion in the output signal.

You cannot see this by simply looking at the plate current meter or an RF watt meter. You can, however, see this quite clearly by studying the plate curves of tubes operating in various plate and grid voltages. The ARRL handbook as well as tube manuals show this quite clearly.

I would not recommend operating the final amplifier in any transmitter at a bias setting that is not equal to the normal bias setting.

From: vk2vzz
Topic: 22262 Message: 22262

I have picked up a TS-820 which appears in pretty good condition. However it has a strange problem with ssb transmit.

Carrier transmit power on CW appears good at around 100W on 80m. However, when I transmit on SSB I'm lucky to peak at 30W with garbled audio.

Also the Compressor does not appear to function either. I'm trying to drive it with a Heil GM-4 which is the only mic I have with a 4-pin Mic connector. My next step was to try and find someone with an MC-50 and try that out.

Regards,

Greg

22263. TS-820s and wattage output.

Hello all.

Recently I have seen my wattage output go beyond 100 watts with only 110 ma of plate current. I checked on another watt meter and same thing. My load control is still set to minimum. Is this possible?
If so then it would explain why the MFJ 969 tuner has arched over several times. I have noticed while tunning for 225 ma that the watt meter on the tunner has gone off the scale. This is freaking me out. As far as I know there have been no modifications to the rig. and I have replaced the screen grid resitors and installed the final cage kit by Ken K4EAA. I have replaced the finals and nuetralized them. But pushing to much power would probably explain why the rig has given me so much trouble.

I appreciate any advice as I was thinking of purchaseing an LDG tunner to replace the MFJ but may have other troubles to contend with.

YES this is the point where the linerity of the PA on SSB is best. If you change the bias point you will get distortion and /or flat topping of the waveform, CAUSING SPLATTER off your frequency,And a loss of efficiency.
If you only work CW it does not matter so much.
I have not used my TS520 on SSB for years but I still check idle ccurrent on SSB mode now and then just "because"...

My input is to try another mic before assuming anything inside the radio is "geschlacht"....
I'm not familiar with the GM4 but many Heil mic/s don't work very well on certain radios. If you have a nice hi-impedance 444 or an MC50 or even a D-104 I would try it first.

Subject: [TS-520_820_530_830] TS-820 with low garbled output on SSB.

I have picked up a TS-820 which appears in pretty good condition. However it has a strange problem with ssb transmit.

Carrier transmit power on CW appears good at around 100W on 80m. However, when I transmit on SSB I'm lucky to peak at 30W with garbled audio.

Also the Compressor does not appear to function either. I'm trying to drive it with a Heil GM-4 which is the only mic I have with a 4-pin Mic connector. My next step was to try and find someone with an MC-50 and try that out.

Regards,

Greg

Your output wattmeter shows the total power going out.
If you have a 100 watt rig, the wattmeter can show more than
100 watts. Why? Because there might be some reflected power
from the antenna, which is reflected back again at the rig, towards
the antenna. This power is added to your 100 watts, going out on
the first pass. This "reflected power gain" is a sign of a bad match
in your antenna system, which is not necessarily inefficient if you
have low-loss feedline....
To find the true output power of the rig, you must subtract the
reflected power.

As an example,

Let's say your rig is putting out 100 watts, and this 100 watts
travels out the feedline to the antenna, where 70 watts is radiated
and 30 watts is reflected. With lossless feedline, the 30 watts
comes back to the rig, and is then reflected back towards the
antenna, in addition to the newly added 100 watts, so your
power meter will read 130 watts. Now you have 130 watts
traveling towards the antenna and a certain portion of it returns
again. This is a recursive action, power bounces up and down
the feedline, a portion of it is radiated each time. You could end
up in the steady state with 130 watts indicated out of your rig,
100 watts out the antenna, and 30 watts reflected. Your rig
is putting out 100 watts but showing 130 watts out on the meter.

Like I say, this is due to reflections in your antenna system.

Subject: [TS-520_820_530_830] TS-820s and wattage output.

Hello all.

Recently I have seen my wattage output go beyond 100 watts with only 110 ma of plate
current. I checked on another watt meter and same thing. My load control is still set to
minimum. Is this possible?
If so then it would explain why the MFJ 969 tuner has arched over several times. I have
noticed while tunning for 225 ma that the watt meter on the tunner has gone off the scale.
This is freaking me out. As far as I know there have been no modifications to the rig. and
I have replaced the screen grid resitors and installed the final cage kit by Ken K4EAA. I

have replaced the finals and nuetralized them. But pushing to much power would probably explain why the rig has given me so much trouble.

I appreciate any advice as I was thinking of purchaseing an LDG tunner to replace the MFJ but may have other troubles to contend with.

Hi Greg. Definitely try another mic on the radio! While I cannot seem to find out the exact impedance of the GM4 element, most Heil elements are low impedance dynamic elements. The do say that the GM5V is for radio requiring high impedance mics.

I have heard many Heil mics in on air comparisons, and have not been impressed with them.

What type of meter are you using to measure the output of the radio? Most watt-meters will not read true SSB power. For example, the meter in my MFJ-941D tuner only reads 20-25 watts on SSB when I am speaking normally into the mic (with the mic gain set according to the manual). This is mainly because the meter needle does not move fast enough. Now if I whistle into the mic in SSB mode (into a dummy load of course!), I see the same output power as I do in CW mode.

I would make sure to follow the instructions in the manual to tune up the radio (into a dummy load), and also follow the instructions as to how to set the mic gain.

Another possibility is that you have some RF getting into the mic at some point.

It is really scary to see the power going off the scale. I need a new tunner I think mine

is defective and was considering getting an LDG auto tuner. Has any one had sucess with thees tuners using a Kenwood hybrid rig. I was told by a fellow ham that the LDG's would not work as well with the hybrid rigs like the MFJ 969. I Have an 80 meter dipole cut to 51 feet each leg fed to a Balun Designs 1 to 1 balun and then fed about 30 feet on RG8X down to rig and tuner. I know that this is not the Antenna Group but maybe some quick thoughts about the tunabllity of such a setup,as I have had a whole lot of problems lately with the tuner and arching over and burning one of the antenna inputs on the tuner as where it attaches to the circuit board on the tuner. I should be able to tune the rig with the 80 meter dipole but the tuner is getting worse and worse. This tuner once did the job. Of course it was second or third hand tuner and am not sure what it was put thru before I had it.Sorry for rambling on so long. But I am getting discouraged with the whole setup. But I still love HAM Radio and Kenwood hybrids.

Hi Thomas,

Seems to me that your real problem might lie with your aerial. The hybrid rigs should easily handle a 3:1 VSWR without the need for a tuner. What's the VSWR on your aerial?

22270. Question about tones on receive

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-02 23:23:09 UTC
From: Bob Singer
Topic: 22270 Message: 22270

Being new to this, I have a question. While tuning through the frequencies, I hear tones that as you tune through them, start out low frequency then go to a peak high freq and then back down. Anyone know what those are?

thanks
Bob

It depends on where you here them....

specify frequencies, check bandplan.

they could be sstv, rtty psk31, and a whole lot more.

they could also be "birdies" from your computer...

I have heard them when I was little also listening on my BC 348R in the
60's. Right now, I hear them on 40M between 14.100 through say 14.300.
I'm sure they are on

Hi. Your antenna is not really an 80M dipole. At 51 feet per side, it will be resonant at 4.589 Mhz. A dipole cut for resonance at 3.8Mhz would be 61.58 feet per side. It is possible that the tuner you have was abused before you acquired it, and it is having problems now because of that.

I am using an MFJ 941D tuner that I had to do some work on. It has some cosmetic defects, but it works very well. It will tune my 80M dipole on all bands. Tuning on some bands is a little tricky, as one leg of the dipole is too close to the house here.

Power readings can vary, depending on the actual SWR of the antenna. The tuner does not really "tune" the antenna, it just lets the transmitter see the 50 ohm load it is looking for.

Resonant antennas are best, but not practical in some circumstances. I would make each leg of your antenna 61.58 feet if possible. The ends can be bent to fit the space you have. Try to get the antenna as high in the air as possible, and as far away from any objects as you can, especially large metal objects. You might try without the balun, just to see if it might be bad.

Do you have a dummy load? You really do need one with these Kenwood hybrid radios.

TTYL

You're probably hearing carriers from rouge SW broadcasters that haven't moved out of the 40m allocation yet. Most of them moved out right away and the band cleared up nicely in the weeks after the change on March 30. Then they started sneaking back in onto their old frequencies.

14.100 to 14.300 is actually 20 meters, but at that low end it could be as I
said, rtty, packet,
14140 usb national calling freq (phone) in Canada
14230 sstv
14233 sstv and digital sstv

the rest on usb could be anything

Yes my bad, no excuse just not reading things right.

14MHz = 20m and 7MHz = 40m.

ok, but unless I missed it, you still need to be more specific. there is psk
and rtty around 7030 (or so), rtty, psk,amtor, and other around 7070-7100,
and voice above 7100-7300 for amateurs, also digital sstv at 7173.... and
sstv at 7175?? 7178???

so you see, we need more spefic as to what you are hearing....
and what mode you are hearing it in, am,lsb,usb you get the idea

Without being able to make sounds on this group, all I can describe it as a whistle. It will start at a low frequency and to up to a high frequency as you initially find it, and then go a few more khz through the frequency band. Right now, I'm on 14.195 mhz and as I tune up in frequency, the tone starts out goes from a high pitch to a low pitch and then nothing at 14.199. Does it again at 14.211 to 14.215. They are all over the band and others. Just wondering what it is. Bob

Topic: 22263 Message: 22281

Don't get discouraged. Antenna problems are easier to fix
than rig problems. The way you talk about your tuner, it may be
giving you trouble.

One thing to do for a quick check: If you have a dummy load,
try transmitting into it. The dummy load should have no reflected
power, so it will quickly indicate whether your problem is in the
antenna system or in the rig or tuner / meter.

I have two LDG tuners. The AT-11 and the QRP. I built them as
kits. I can't think of any reason they wouldn't work with a hybrid
rig. They will probably go into auto-tune mode if you adjust the
tuning and loading controls on your rig, however.

To use an auto-tuner, I first would use a dummy load and tune up
your rig on the freq you want to use. Once you're tuned into the
dummy load, don't change anything, but now connect the LDG and your
antenna instead of the dummy load. The LDG should find a match and
you're good to go. While the LDG is searching for a match, you
could reduce the power output by turning down the mic gain, that'll
make it easier on your PA tubes.

I prefer the manual tuners, however. They have coax switches, and I
can put a dummy load on one of the antenna ports. One of my manual
tuners has a built-in dummy load which is a great idea.

The auto-tuners work great for transistorized broadband rigs like
the Ten Tecs and my QRP kits.

One tool that I am constantly using is the MFJ Antenna Analyzer,
MFJ-259B. You can adjust your tuner for a 50 Ohm match quickly.
The MFJ model was the first of its kind and there are several other
brands available now. My only gripe about it, is that the meter
gets jumpy when you get close to the 1:1 point. I guess it is doing
some math internally and results vary widely when dividing by numbers
that are close to zero. (The reflected power goes to nearly zero.)
The scratchy roller inductor is the culprit.

Your 51' per side dipole sounds like it started out as a G5RV.
The balun and RG-8X may work or maybe not. I used to have a G5RV,
and I cut off the balun and coax and ran twin lead (450 Ohm window
line) straight to the balanced antenna posts on the back of my tuner,
an MFJ-989C. I used that antenna on all bands 80 - 10 with the
tuner, good results. I even forced it on 160 but it wasn't good.

If you're having trouble loading up on a certain band, try adding
or subtracting 25 feet of coax. It could be that you've been using

a length of coax that is impossible to match. Changing the length of coax will change the impedance that the tuner sees, and may bring it back into the matchable range.

You will have reflections on your coax, because it isn't a resonant antenna, but only 30 feet will not make great losses. However, high RF voltages could result in arcing and scorching your tuner. The tuner could be getting worse with time. Adding another 25 feet of coax won't increase your losses very much, either.

Your 1:1 balun is fine and should prevent radiation from the shield of your coax. You're not getting RF burns in the shack are you?

Sounds like a tweak here and there and you will have your problems licked. Try the dummy load, isolate the problem. If it's the antenna that can't be matched, try adding some coax. If you get an auto tuner, tune into the dummy load first.

If there's a rig problem, maybe somebody else in the group will be better to help you. The tube finals are pretty rugged, however.

And that's all I have to say about that. (-Forrest Gump)

Mark KR5N dit dit

Hey Mark, Thanks for the reminder of how the SWR behaves in the antenna as to the output power of the rig and the reflected SWR adding to the output. This must be what is happening with my rig.

Hi Guys. You should ALWAYS tune up the transceiver into a dummy load!

Especially when trying to establish a baseline for troubleshooting power output problems. Using an antenna is like trying to wash your windows with chicken lard.

22284. TS-520 Available in N. Florida

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-03 18:32:13 UTC
From: Shawn Jones
Topic: 22284 Message: 22284

Hello everyone,

My name is Shawn, KJ4KNW, and I need to send my 520 to a better home. I bought this rig from a fellow ham after I earned my ticket earlier this year. I have made many contacts with this rig and learned a lot in the process. As far as I can tell it functions great, but with anything this old there are a few issues. There is an intermittent connection to the lights above the VFO, they don't cause any issues other than sometimes their on, sometimes not. The clips that hold the cover over the side adjustments are bad, the cover stays in place, but will fall open as soon as the radio is moved. The radio itself seems to be fine, and looks pretty good for it's age. I have the manual and service manual.

Here is my story. I have recently moved back to Florida due to a divorce (not because of the radio), and have been forced to start over. I went ahead and enrolled full time into the college here in Gainesville. As a veteran, I used the new GI Bill to pay for my school. This new bill includes book allowances, and a monthly allowance to live on. Many students including myself were told that the checks for our expenses were to arrive earlier in the week. When they didn't, I called the VA and was told that they are backed up in paperwork and I should receive my first payment in 8 weeks! The xyl made sure to clean out the account (and then some) so without the VA, I'm up the river. I also have to commute 45miles into school. 90miles a day has taken it toll on the cash that I had. I don't have money for books (for the classes that I started last week), I don't have money for my additional supplies, or for the gas to get me there. The only thing that I have left is my dog, that radio, and an apology from the VA. Unfortunately, I tried buying gas, books, and a backpack with an apology, and it didn't work.

The reason I gave you all that info is so you can get an idea of the mind frame that I am in right now. Divorce, custody, money, and school. And even for a young guy like me this is wearing me down bit by bit. I payed $275 for the radio, what I need is a thousand dollars, but thats not going to happen. If you are interested (please be interested) just make a reasonable offer, I would prefer someone local so that this can be done quick and easy, I really needed the money last week. If anyone is interested please feel free to email me.

Thanks everyone and 73,
Shawn

Bob,

Is the tone showing up every 25KHz?
Sounds like your getting the 25KHz calibration tone.
Check to see if your function is set to 25KHz.
If so, switch to VFO it should go away.
That's the only thing I can think of.

Mike - KI4FDH

There could also be a Plasma TV in his neighborhood causing dirty carrier type interference at regular intervals across the band.

Disconnect the antenna. If the noise is no longer heard when tuning, the source of the noise is not in the radio.

22290. TS 820 Cleaning

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-03 22:44:19 UTC
From: blacklabpupp
Topic: 22290 Message: 22290

I have a TS 820 that is nothing more than a shelf queen. It is like new and hardly ever used. I decided to take a look inside an clean it. The fan was unpluged because it has rarely been used to transmit. My question is where do you oil it? I heard over 20 meters today that they should be oiled and a general cleaning yearly. Inside it is like new and very little dust, if any. What else should be done? I noticed a few weeks ago while listening to W1AW code bulletins, that it seemed to jump around in freq. I first thougth it was W1AW but I now think it was my rig. It does not have a digital display only analog. Not the S model. But I supect that it needs to be cleaned around the enclosed tuning cap. When I was given this rig I was told it had only be opened one time to install the CW filter. I am also thinking it might be time to explore changeing the main filter caps as well. Any advice about cleaning or anything else that should be done. I would like to keep it as new looking as possible. Gene

Hi Gene,

Any Kenwood transceiver that old needs a tune up.

1. Start by loosening and retightening "every" screw used to mount PC boards.

2. Remove, clean with de-oxit or alcohol every connector and re-seat them (especially the ones that plug into the boards with signal and control lines.

3. Replace all electrolytics before they short and take out costly components. I would replace the bleeder resistors across them too.

4. Clean every switch especially the band switch wafers and mode switch contacts.

5. The main tuning cap inside the vfo may have dirty wipers on the rotor ground clips which could cause frequency jump, but I wouldn't open it up until all the other stuff is done. The majority of intermittent problems in Kenwoods this old are connection related so do the easy connector cleaning and tightening circuit board mounting screws before doing a "VFO-ectomy". Your problem may just go away.

Hope this is helpful,

Greg

Forgot one essential tip.

IF you use De-oxit to clean switches make sure you let the radio dry completely before applying power. That stuff when still liquid can definitely cause unintended shorts with AC applied.

Greg

22293. Freq Counter for TS 820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-04 06:55:46 UTC
From: blacklabpupp
Topic: 22293 Message: 22293

I have seen a few companys selling counters for older rigs. I have contacted them and get no real help on if their product works on the 820. Does anyone know of a counter that can be used on the 820 externally? I am not looking for one to go inside the unit. But I know something can be easily connected some way with all the counter projects out there. Also how would it be connected if I could find one. This should be easy, but I cant figure it out. Gene

22294. Re: [TS-520_820_530_830] Freq Counter for TS 820

Hi Gene,

Try this company.

http://www.aade.com/dfd.htm

I have one of his displays to suit my 520S and I think it will work on your 820. Drop him a line to confirm. You might need to add a preamp to boost you local oscillator.

Gene,

The symptoms of VFO instability will be evident by erratic tuning when rotating the main tuning knob. This is easily seen if the 820 has the digital display installed, the digital display will be erratic while tuning the VFO. To eliminate this problem, the VFO's variable capacitor shaft to frame connection inside the VFO requires cleaning. You do NOT have to remove the VFO to do this!

The VFO has a small metal plate on the right side of the VFO enclosure. Remove one screw and loosen the other. Rotate the plate to gain access to the variable capacitor's shaft to frame connection. Apply a small amount of contact cleaner to the affected area then rotate the VFO from 0 to 500 and back a few times. Use canned air, available at Walmart in the computer department, and direct the air flow at the connection. This removes excess contact cleaner. Wait 3 to 5 minutes (see warning/caution on the contact cleaner can label) before applying power. Check the VFO's stability when tuning. Repeat if necessary.

Next thing is to check and, if necessary, adjust the 3.3VDC and 9VDC supplies. Allow the 820 to warm up for 30 minutes before performing the following voltage checks and adjustments. Since the 820 is quite old, components age resulting in changes. More than likely the 3.3VDC and 9VDC voltage will "drift" upward. This is the result of aging D5 (6.2VDC zener) and Q7 transistor on the AF UNIT.

To check and adjust the 2 voltages, remove the top and bottom covers, turn the 820 upside down with the front panel facing you.

The 3.3VDC and 9VDC supplies are located on the AF UNIT.

The AF UNIT is the small PC board in the middle, directly behind the front panel.

There are 2 plugs along the front of the AF UNIT labeled "AF1" and "AF2". AF1 is on the left and AF2 on the right. Plug pin numbering is from right to left, 1 thru 6.

To measure the voltages, use a small gauge (diameter) piece of wire inserted into the plug where the wire enters the plug. Be careful not to "force" the wire since you could damage the wire connection to the plug's female receptacle.

Connect a DC voltage meter's positive lead to the wire in pin 1 of AF1, negative lead to chassis ground. The voltage should be 9VDC. If it is not then adjust VR4, located in the middle of the AF UNIT, for a 9VDC +/- .05VDC reading. Do NOT adjust the light colored pot, that is the "RIT" pot. Use a plastic flat blade adjusting tool to adjust VR4. A metal screw driver could result in a short, possibly damaging surrounding components.

Move the DC meter's positive probe and short piece of wire to plug AF2 pin 6. The voltage should be 3.3VDC +/- .05VDC. If it is not, adjust VR1 located between plugs AF1 and AF2 for 3.3VDC.

It is important to adjust the 9VDC "first". If you adjust the 3.3VDC first followed by adjusting the 9VDC, the 3.3VDC voltage level will then be "wrong"!

The 9VDC provides power for the internal and external VFOs. The VFO's 9VDC power source flows through the FUNCTION switch wafer S5-3 and to the rear 9 pin remote VFO socket, pin 9. If the remote VFO-820 is not plugged into the 9 pin socket, a connection MUST exist between pins 8 and 9 in order for power to be applied to the internal VFO. With the connection between pins 8 and 9 and the remote VFO-820 is not used, the internal VFO will not work, resulting in a "dead" TS-820, no receive and not transmit.

There are 2 small black can capacitor on the top left rear of the 820 chassis. These are the filter capacitors for the LV supply (300A, 210A and 210B). Each can has "2" 22ufd 450VDC internal capacitors. There are no direct replacements for the 2 canned capacitors. I replaced both cans with 4 radial lead 22ufd 450VDC capacitors mounted and soldered to a single terminal strip, under the chassis.

The Rectifier Unit, located on the bottom of the 820. With the 820 upside down, front panel facing you, the Rectifier Unit is located to the "left" of the power transformer. There are "2" 33ufd 160VDC axial lead capacitors mounted on the Rectifier Unit PC board. These are the "bias" supply (-C) filter capacitors. These should be replaced! A failure in the bias supply WILL affect the final tubes and WILL result in high current flowing in the final tube in transmit, regardless of the MODE switch setting. When this occurs, the final tube plates will glow "RED" which can lead to damaging the final tubes and blowing the fuse.

The final tube's HV filter capacitors are located directly behind the internal VFO. Each capacitor is a 100ufd 500VDC electrolytic. Each capacitor has a 470K 1/2 watt resistor and a .01ufd 500VDC disc capacitor connected across each capacitor's terminals. Age can and will affect these 2 HV filter capacitors. K4EAA has a replacement kit for the HV filter capacitors. I recommend replacing both capacitors along with the 470K 1/2 watt resistor and .01uf capacitors. Pay close attention when replacing these capacitors since they are wired in "series" in a voltage "doubling" supply. Wiring these capacitors backwards or incorrectly can result in permanent damage to the new capacitors and possible damage to the power transformer and surrounding components.

The Relay Unit, located on the bottom of the 820 chassis, has "2" 2200ufd 25VDC radial lead filter capacitors. These capacitors are the filter capacitors for the "14VDC" supply. The 14VDC supply is the source voltage for the AF UNIT's "9VDC" and "3.3VDC" supplies. A failure (short) in one or both of the 2200ufd 25VDC filter capacitors will result in a complete loss of voltage from the 14VDC supply resulting in zero 9VDC and 3.3VDC voltages. Replace both capacitors.

If, after completing the above suggested replacements and adjustments, you find there is no ALC indication in TUNE mode, replace both R5 and R6 on the HV Unit.

These are the most important capacitor and resistor replacements as well as voltage adjustments in the aging 820. Use standard safety precautions when performing these tasks. The 820 has voltage inside that can kill you! Be SAFE!!

I always recommend using canned air, again, available at Walmart, to remove excess contact cleaner. Contact cleaner is flammable and it only takes a small spark to ignite it. Always follow the warnings/cautions on the cleaner's can label! Use only enough cleaner to perform the job, a small amount goes a long way. Do NOT soak or use excessive contact cleaner, a small amount goes a long way!

There are other areas that may require cleaning such as the "sandwiched" PLL, CAR, and, if installed, the COUNTER ASSY UNIT PC board assemblies which require removal of each

enclosures and the internal fixed connecting pins cleaned with contact cleaner.

As previously stated, a number of the problems with the hybrids can be eliminated by simply cleaning. If the steps outlined appear to be more than you feel comfortable doing, may I suggest obtaining the services of a local ham who has the skills to help you with these steps.

I have a TS 830S, Serial # 2110605 for sale. Very nice shape. Loaded with filters: YG-455C, YK 88C, YK 8851 ssb, 455 khz ceramic. Recently back from Ken, K4EAA, with complete alignment, brass shaft coupler, complete check-up. Everything works, full output all bands. I have used this radio most qrp/cw. Includes paperwork from Ken, original manual and Service manual. 475.00, + USPS shipping to you from Maine.

Hello,

I've found a TS-830S front panel on ebay, but the seller wouldn't ship it outside the U.s.

He told me that I could buy it and ask him to send it to a friend or relative of mine in the US, but I don't have one in order to forward the package thru lowest fare US Mail to me.

Please, if someone could lend me a hand with this matter, I would really appreciate it.

Thank you in advance for your kind assistance.

I had a 2M , TV502, Transverter for my TS520.
 Just save your money, or get one of the Ten Tech or Microwave Associates transverters.
They actually work.
The Recieving part of the Kenwood had a horrible conversion loss and would need a 20 dB preamp installed inside it to work at all.---
Also the 10 W output will not get you far, need a power amp to stay even with the average station.!
The 6M version may be better, maybe others will lchime in with thier experiences.

Anyone seen a 6 meter transverter for the TS -520s available on the net?
Ken

If your antenna is cut to 51 feet on each side, YOU DO NOT HAVE AN 80 METER DIPOLE. You have something quite different and are trying to make it look like an 80 meter dipole by adding or subtracting reactances. The problem with this is that the setup you have is putting the reactances (your tuner) at a high voltage location along the antenna system.

An LDG tuner (or most any other tuner) would have the same problem unless it was designed for insertion into a high voltage node.

You would be better off making a better antenna. Quite possibly the existing tuner, if not damaged beyond repair, could be used if it is coupled to a proper load. Most Hybrid (tube output) radios will tune into a large variation of loads due to the Pi-Net output which is essentially itself a TUNER.

Good luck!

Ken Hunter - KB7H

> It is really scary to see the power going off the scale. I need a new tunner I think mine is defective and was considering getting an LDG auto tuner. Has any one had sucess with thees tuners using a Kenwood hybrid rig. I was told by a fellow ham that the LDG's would not work as well with the hybrid rigs like the MFJ 969. I Have an 80 meter dipole cut to 51 feet each leg fed to a Balun Designs 1 to 1 balun and then fed about 30 feet on RG8X down to rig and tuner. I know that this is not the Antenna Group but maybe some quick thoughts about the tunabllity of such a setup,as I have had a whole lot of problems lately with the tuner and arching over and burning one of the antenna inputs on the tuner as where it attaches to the circuit board on the tuner. I should be able to tune the rig with the 80 meter dipole but the tuner is getting worse and worse. This tuner once did the job. Of course it was second or third hand tuner and am not sure what it was put thru before I had it.Sorry for rambling on so long. But I am getting discouraged with the whole setup. But I still love HAM Radio and Kenwood hybrids.

Thanks so uch for all the advice. After reading the posts I decided to take a looking into the one I use. I came across some problems that I must attend to now. If I tap or move the AF board the 9volt jumps around. It certainly is not stable. I am guessing that the regulator and VR4 are faulty. Why not replace the VR with carbon resistors. During measurments I get different readings on the Ohm meter. I am not sure what to replace it with. Does anyone know off hand what the resistance should be? The page I downloaded is not clear. On the IF board a I cannot even read the voltages because someone blacked them out or poorly scanned. I also noticed the 2200uf caps 23 and 24 I believe, have a small buldge in one. The connectors all seem to be ok. I cleaned most of them today. After opening the one I use I am somewhat afraid to open the unused one. I guess I should just order a complete replacement or caps and some resistors. While I am taking on this project which transistors should be replaced? All or some or most? I plan on getting new voltage regulators to say the least. Thanks for all the advice because it came in handy and very useful. All the best Gene

> I came across some problems that I must attend to now. If I tap or
> move the AF board the 9volt jumps around. It certainly is not
> stable. I am guessing that the regulator and VR4 are faulty.

No, not necessarily Gene. A loose connection can produce this symptom. A dirty VR4 can also produce the same unstable symptoms. The AF UNIT's ground returns are through the board's mounting hardware (screws). If one or more of the screws are loose, any vibration can result in an unstable ground which will lead to the symptoms you are experiencing.

> Why not replace the VR with carbon resistors.

If you do that then the 9VDC and 3.3VDC cannot be adjusted. In addition, installing the exact resistance required for the 3.3VDC and 9VDC, +/- .05VDC, will be quite difficult, if not impossible, leading to improper 3.3VDC and 9VDC supply voltages! Not a good idea!

Age can result in corrosion build up on VR4 which can result in the symptoms with VR4 you are seeing. Cleaning the pot with contact cleaner should be done first before even considering replacing VR4.

> I also noticed the 2200uf caps 23 and 24 I believe, have a small
> buldge in one.

If a capacitor has a bulge then it should be replaced regardless whether it checks OK on a capacitor checker or not! The bulge indicates excessive heat build up inside the capacitor.

> While I am taking on this project which transistors should be replaced?

Until there is evidence a transistor is bad, there is no need to replace any transistors.

From: vk2vzz
Topic: 22262 Message: 22306

Well I've now tried a borrowed MC-50 and my MD-100 after a made up a cable. Both Mics give similar results. Very low transmit power. And if I turn the compressor on. Then nil output. So it looks like the problem was not the MIC. Looks like the rig is the problem. The meter I'm using has a PEP wattage indicator which appears reasonably accurate when my Yaesu FT-450 transmits. However, the most I can see indicated with the TS-820 with 1500hz tone into the MIC is about 20 Watts. Speech is lucky to move the needle unless I speak loudly against the mic.

Any suggestions on where to check first? I was thinking somewhere on the IF board in the MIC Gain circuit. However, any suggestions are welcome.

Greg

Greg,

I would follow/trace the audio signal starting at the IF UNIT's plug 7 pin 1 working my way through the speech amplifier Q19, Q20, Q21, and up to the balance modulator (diodes D29 thru D32) using an oscilloscope.

22308. Maintenance turns into death.TS-830S 12 volt buss supply

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-05 18:39:49 UTC
From: ki6nda
Topic: 22308 Message: 22308

Greetings,

I've killed my TS-830S. I'm hoping I may be guided to a repair.

What happened...

The rig has been stored about 3 months. Before that, it had worked great. No issues except needing alignment of the coil pack unit, which I've been putting off. And the PBT pot needed cleaning. Also the meter didn't register in the COMP position. After hooking it back up, I decided to clean that pot, and tighten the boards. This had cured the meter issue in the past. I used Deoxit on the pot, blew out the dust, and loosened and retighened the boards. Hooked everything back up, and was dismayed to find the only thing to light up was the meter. All functions are dead. I've killed it. This is the recent history.

Covers off, DVM in hand...

TP6 on the AF board reads 0 volts. So...

14.4 VAC on Pins AC14 read at the rectifier board.

0 volts on Pin G14 at the rectifier board.

19.2 volts DC on Pin 14A at the rectifier board.

Have I toasted Q30 and Q34 on the AF board? Any coaching would be greatly appreciated!

Thanks in advance,

73s, Jerry KI6NDA

Hi all, My Dad told me about this great group on yahoo and about all the info here so I have a few questions. I just picked up a couple of old Kenwood TS-520's for cheap and want to start using them but I have a few problems... One rig only puts out about 5 Watts so will start with the other that at least has about 85-100 watts...

The seconded one I have has a slow going time going from Trasmitt back too recieve. It just hangs there in Trasmitt and then slowly goes back too recieve. Sometimes not and if I give it a good old tap on the side of the case it finally slowly goes back too recieve. Now I know there are relays that can stick and that is what I suspect. I have a maual for it and it does say bad T/R relay. My question is "Where can one start too look for it ?? The manual say (RL2) on a bottom view and I had a spare relay and replaced it with hopefully a good one. The rig still does the same thing. Can anyone tell me where the others can be as I know what I am looking for. I just don't want to tear the whole rig apart to find it...

Help Please !!!!

Hi Dan, Welcome to the group!
 you are in the right place to get help with your fine old 520's!

If you look me up on QRZ (KB8OCP) you will see a pic of mine.
One is always on..I love these 520's!

Yes, the T/R Relay may be sticking, and you probably have dirty contacts on the band switch and My first impression of your description, both rigs
may do very well with a good bath.
You may find that a quick squirt of de-oxit on
the band switch-T/R relay and the front panel
controls..especialy the jjy/wwv button will help.
work the switches and buttons several times with the
power off.. give a half hour before powering back
up and give all the controls a good work-out.

Pick the worst acting 520 to start a good teardown/ cleaning. I know you said you dont want too. but
it really is the best way to get these fine rigs
in tip top shape..and you may learn to love them like we do!

I'd find out if it includes the interface cable
before bidding too much, if at all, on it. If you think the
Kenwood transverters are getting hard to find wait till you
end up with a transverter with no cable. I haven't been looking
since completing my 520S station but, I don't recall ever
seeing just the transverter cable for sale.

Jerry,

Based on the information and voltage levels you provided, it is possible that one or both, Q30 and/or Q34, on the AF UNIT could possibly be bad.

However, before changing Q30 or Q34 on the AF UNIT, may I suggest checking filter capacitors C83 and C84 on the AF UNIT. These capacitors are are the filter capacitors for the 14VDC supply. A short in one or both capacitors can result in a failure of the 14VDC supply.

The 14VDC supply provides the "base" voltage for the 3.2VDC, 9VDC, and 12VDC supplies.

The PLL UNIT, AF UNIT, IF UNIT, COUNTER ASSY UNIT, and portions of the RF UNIT, all are powered by these LV supplies. If the 14VDC supply fails so do the other LV supplies resulting in an 830 that appears "dead" when powered on.

The dial lamps and tube filaments are powered by a separate 12VAC secondary winding of the power transformer so they will illuminate.

Thanks for the reply Dave. I will see if I can clear a good spot on the desk and start to clean it the best I can, Dad did the same thing on his 520 except a full complete dismantel but I agree with you with a rig over 30 some years old its is probley do for it. I am not really any expert in radio repair but I am starting to fall more for the old rigs and want to learn more about the old time radios..

Well if theres a design out there I would jump dead on it I love tro build gear. Yes I seen the 6m transceiver and the transverter was going to bid on both but it looks like the bidding has already went nuts. The way I do it is set a (what I will pay budget) then wait till the last few seconds to bid. If I get it cool if not it went past budget and it just was not in the cards.

Hi Dick,

The Kenwood transverter cable uses special connectors that are
probably more difficult to come by than the original cable. There is
of course no reason why you couldn't change the connectors to
something more common but I think in most cases folks won't want to
make significant changes to their equipment. The other option is to
make a transverter from the ground up (google is your friend) and use
the transverter in/out connectors on the back of the radio and skip
the special cable altogether.

To do it "right" you need the even harder to find,
12 pin Hirose connectors. When I was shopping,
I saw a few that were "hacked", bad job, using 25 pin
computer plugs which meant I would have to hack my TV-502
and I didn't like that idea too well, so I passed on them.

So, if you have the connectors or don't mind modifying your
equipment there is no reason one couldn't make a cable.
Page 13 of the 520S manual shows the pin out for the cable.

Mike,

Thank you so much for sharing your thoughts. I was hoping you would stop by.

I have the HI RES schematic from Ken's excellent site, and also have the Service Manual in PDF. Using circuit trace info in the Service manual, and the schematic, I've confirmed with "in circuit" testing (resistance checks) that both filter caps (C83 & C84) are OK. At least in a low voltage resistance test. I can see them charge, and very high resistance to ground. However...

While poking around, I was able to get a voltage reading off the base of Q34. Virtually the same as the emitter voltage (19.2 to 19.3 VDC). And 0 volts on the collector. So I happened to check resistace to ground on the Collector side. This is the 12.5 volt buss (buse ?) leading into Q30. It read 4.2 ohms to ground. Hmmm, well that doesn't look to good! C81 catches my eye, and interestingly, it has a very slight wiggle to it. And it has a red ink mark on it from a prior owner. Very interesting.

Conclusions:

Would you agree C81 needs to be removed and checked for a short. If it's not the culprit, a contiuned search on the collector side on Q34 for a short?

My gut tells me Q34 is probable gone, as it's collector went to near ground. Q30 is probable OK. Would you agree, or am I getting ahead of myself? A quick search for 2SA473Y turned up nothing for a source, but appears to cross over to NTE153. The specs don't look the same, but cross reference says it works.

Again, thanks much.

Sounds like the VOX controls on the side are not adjusted for the way you are operating.
Try turning OFF the VOX control and operate manually with TX switch on the front or the PTT button on a mic.
IF that cures slow t/r switching then you need to get the operators manual; and adjust the VOX settings.

I have found that there are a few 6 meter kits out there and I am digging out my old ARRL handbooks I remember seeing a transverter in one of them. Anyone know what year it was I think it was for 6 meter, anyway I need to stay on budget.

22325. Re: Maintenance turns into death.TS-830S 12 volt buss supply

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-06 21:17:03 UTC
From: w5rkl
Topic: 22308 Message: 22325

Afternoon Jerry,

It is possible C81 could be bad. The only way to determine if it is, is to check it. By checking C81 you are not jumping ahead.

Q34's emitter and base voltages should be within ".7VDC" of each other. I suspect this is true from your emitter and base voltage checks. However, if Q34's collector voltage is zero then yes, I agree, Q34 appears to be bad. I also agree, but not sure at this point, that Q30 may NOT be bad.

I would not rule out Q31, Q32, and Q33 plus D26.

D26 is a 9 volt zener, most likely rated at 500mw.

I suspect you can find replacements for Q31, Q32, and Q33 plus the 9 volt zener quite easily.

Look at the specification sheet then compare the specs to modern NPN and PNP transistors.

My first replacement thoughts for Q33 (PNP) could possibly be a 2N3906. For Q31 and Q32, possibly a 2N3904 (NPN). I have not compare the 2N3904 (NPN) and 2N3906 (PNP) against the Japanese transistors, 2SC945Q (NPN) and the 2SA1015Y (PNP).

The 820 uses a 2SA496Y in a similar but slightly different power supply circuit on its AF UNIT. I am not sure whether a 2SA496Y will work in place of the 2SA473Y. I have not compared the two transistor's specifications. They both are PNP power transistors that require a heat sink. The 2SA496Y is available for a $1.00 at the following website. I've purchased 2SA496Y's from them before and they are easy to deal with.

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

Before considering using a 2SA496Y in place of a 2SA473Y, I strongly recommend comparing the 2 transistor's maximum specifications first and note any differences in pin designations.

I hope this helps.

I checked out the web site and wrote the guy, but he is not knowledgable about the TS 820. I dont have and idea how to connect it. Since I am about half blind I need someone to tell me exactly where to look. I am glade you were able to make it work on your rig. I would like to mount one externally. I stopped tonight working on my most used rig, TS 820, soldering in the new caps. A fellow ham tomorrow is taking it to his shop and will recap it for me. Looking through a magnafing glass, and soldering was to difficult for me. 60 caps was going to be to difficult. I am really glad he offered to finish it for me. Soldering in a CW filter, or taking a few measurements I can do but some projects are more than I can handle. But thanks for the link. I might just order one anyway and try to work it out myself. I think it is worth the effort. Gene

Does anyone know of a counter that can be used on the 820 externally? I am not looking for one to go inside the unit. But I know something can be easily connected some way with all the counter projects out there. Also how would it be connected if I could find one. This should be easy, but I cant figure it out. Gene

Date: 2009-09-07 07:52:13 UTC
From: trippkj4bkd
Topic: 22327 Message: 22327

Hello All,

I aquired a pair of new GE-6146W final tubes at hamfest and currently are running 6146b Penta Lab tubes. I have been told that my Penta Lab tubes were of poor quallity as they were difficult to nuetralize and would only nuetralize from 75mv to about 40mv. That is why I purchased the 6146w tubes. I am not sure what settings on the Ocilloscope to adjust to see mv bleed off from the new tubes. What setting have others used on their O scopes. I understand that I am looking to get down to about 10mv or so. I understand the procedure as I have read but I am not sure how to adjust the O scope to see it. I am not sure weather DC or AC what setting on time/volt scale. Is there a video of someone nuetralizing tubes someware. I would like to watch.

Any Way thanks for any help.

From: vk1dw
Topic: 22328 Message: 22328

Hi All

I am about to re-activate my TS 520 S after it has not been used for about 12 years. Are there any accepted procedures for bringing the transmitter back into action?

If this topic has been covered in any posts please point me in the right direction.

Regards

Deane

> giving you trouble.
>
>
Hey Mark thanks for the encouragment and I think I have narrowed down the problems.For one I had most likely cooked my tuner over time.
and secondley I have an antenna that will not tune properlly on all 160 thru 10. now that I have a new tunner I can see that my antenna is not very resonant on a lot of bands It is very tunable on 20 meters but not so good on others. I am going to try adding about another 25 feet on the the ends 12 1/2 each leg. That would give me 127. That seems a little long I could always trim back. I do not want to kill my new tuner so I am going to take slow and easy and yes It has the built in dummy load that i will tune my rig up first on that.

Thanks for the suggestions and I will come back with some results if any one is interested in hearing how it comes out.

22331. TS-820 and D-104 using VOX possible?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-07 11:52:50 UTC
From: k5lcl@sbcglobal.net
Topic: 22331 Message: 22331

I just recently bought a TS-820 and wired a D-104, per the instructions below.

pin 1: white
pin 2: black
pin 3: red
pin 4: shield

The radio works fine on SSB, using the PTT switch/handle on the D-104. I get good audio and signal reports, with this combination.

I cannot get the VOX function to work on this fine old radio. The switch in the base of the stand is set to "R". I don't know if the mike is properly wired for VOX, or if there is something else I have to do to the radio, besides flipping the VOX switch on and adjusting the VOX Delay, Anti-VOX, and VOX Gain. Any ideas?

Hello Guido, Ask again politely and reasure seller that you would pay first for shipping and product and would not mind to wait for funds to clear before seller ships item. Also provide exact adress so that shipping charges could be calculated acurratley and shipment would not get lost. I had a time with lost shipment from Argentina once. Maybe seller will say Ok maybe not. Good luck.

Good morning Mike,

A small update...

When I tilted the AF board down where I could get at the trace side, I saw how nasty it looked, so spent some time cleaning it up with denatured alcohol and a tooth brush. Nice and spiffy now. I pulled C81, and found it to be good. Not the source of the short. Then I went ahead and pulled Q34 since we know it to be bad. It came apart on me as I removed it. So much for that.

Where I'm headed, and why. I believe the source of the short to be somewhere else in the rig. When looking at the schematic, specifically the 12.5VDC line from the collector of Q34 to the emitter of Q30, all other components (active and passive) on that line are above ground from resistors tied to their legs. Even if they are all bad (Q31, 32, 33, D26), and shorted, they all have resistors on their legs going to ground. The only exception is C81, and it tested good. However, there is an un-numbered TP right at the emitter of Q30 that has three wires attached, leading off to other locations. I believe I'll find my short down one of those lines. Then, I can return to the AF board to find all the damage done. If I'm "off base" here, please correct me. :)

Bonanza! The link you provided has the 2SA473, but without the (Y) on it. There is only one data sheet I can find on the web for this trasistor, and it makes no mention of any letters added to the component. Q31 and Q32 are also availible, but Q33, and the zener are going to take more digging. At least I can get Q34, and this is the only one we know to be bad, at the moment. Thanks much for that link!

Again, many thanks Mike. Please correct me where needed. :) Your input is greatly respected.

Topic: 22331 Message: 22335

The internal wiring for both the PTT bar switch and the microphone element depends on the D-104's base wiring and, of course any previous owner's rewiring/changing of the base wiring.

I doubt the transceiver's VOX is the problem. More than likely the microphone element is connected to a normal "open" switch contact that only closes, connecting the microphone element to the microphone plug, when the PTT bar is squeezed.

Here's a link to the wiring diagrams to a number of D-104 using different bases. There in a small plate along the bottom edge of the base that signifies the type of base the microphone is attached to.

http://barovelli.com/index.php?blog=3&p=86&more=1&c=1&tb=1&pb=1

The D-104 wiring is also pasted on the inside bottom cover as well. Remove the bottom cover and look at the wiring.

Hi Tripp,

Adjust your 'scope so you can comfortably see the carrier. It won't matter if the 'scope is AC or DC coupled as the output circuit of your radio has a DC blocking capacitor. If you want you can wind up the timebase (faster) so you can see the carrier as a sine wave but it's not really necessary. Then adjust the neutralizing cap for a minimum level. It may not come down all the way to zero and that's ok, just look for the minimum.

is the radio is set to vox also..... I beleive the d104 vox circuit only bypasses having to use the ptt, so the radio still has be set as well.

how is hte battery in the d104 (is it an amplified mike), is it a high impedence mike?? it may just NOT be driving the audio circuit enough for vox to trigger

try a different mike

Jerry,

Q34 crumbling in your hands as you remove it? That's an indication of excessive current flowing through Q34 due to a short to ground across the 12VDC supply (12 terminal on the AF UNIT). That's why the digital display didn't work, no receive, and only the dial lamps and tube filaments lit when power was applied. Remember, Q34 produces 12VDC that is fed to Q30 which produces 9VDC. If Q34 fails, all of the LV (3.2VDC, 9VDC, and 12VDC) supplies also fail resulting in your 830 being dead.

I recommend checking D12 on the Rectifier Unit. If D12 is found to be bad, a 1N4007 will do fine as a replacement. Also, if D12 is found to be bad, make sure you install the replacement diode correctly (banded lead connected to the "12" terminal on the Rectifier Unit).

I also recommend checking the rear panel's SG switch. It should be in the "ON" position.

To check D12, pull one lead of D12 from the Rectifier Unit's circuit board. Do not assume D12 is fine simply by looking at it. Diodes can fail, open or short internally, and they will look fine on the outside.

73's
Mike W5RKL

22341. RE: [TS-520_820_530_830] Re-activating TS 520S

From: Sulaiman Abdullah
Topic: 22328 Message: 22341

I would check inside first,

at least see that the valves are nicely seated and check for electrolytic capacitors that may have leaked, you should deal with any before applying power.

a light dusting may be ok, and a quick look for anything obvious.

the hv electrolytics would be best charged slowly, via a variac for example.

if not then put a mains filament lamp in series with the ac input, and be ready to switch the mains off quickly if you see/hear/smell anything wrong.

I haven't serviced my own TS-520S yet, this is just general advice, others may have more specific suggestions.

Subject: [TS-520_820_530_830] Re-activating TS 520S

Hi All

I am about to re-activate my TS 520 S after it has not been used for about 12 years. Are there any accepted procedures for bringing the transmitter back into action?

If this topic has been covered in any posts please point me in the right direction.

Regards

Deane

Topic: 22331 Message: 22342

Hi Guys. It looks to me like in the amplified D-104 mics, the amp is only on when the mic is keyed. The amplified D-104 mics were mainly meant to the CB market, and some CB radios had problems if the amp was not off during receive.

If you do use VOX, you must be careful NOT to get onto the bad habit of saying ahhh, ohhh, ummmm etc... to keep the radio keyed when you want to pause longer than the VOX delay. You will also find that when using VOX, you will want to be in a quiet room, especially using an amplified mic.

Having used D-104 amplified mics in the past, I know that even setting the gain on the mic to bare minimum, and using the mic gain on the radio to control ALC settings, the D-104 can pick up any small noise in the room and key the radio when you are not speaking.

The worst example of this that I know of is of a CBer that was using VOX. He went to the bathroom and urinated (the bathroom was 3 rooms away) without closing the bathroom door. When he started to urinate, the VOX keyed the radio, and all of his friends on the CB got to hear the event, including the flush at the end.

VERY embarrassing to say the least!

Radio is set to VOX, gain adjusted all the way up, (and everywhere in between), anti-VOX is adjusted all the way down too. It is an amplified D-104. I'm just guessing, but if I get good signals on audio, in SSB mode, wouldn't it be driving the audio circuit high enough? Impedance, in D-104 manual, says 5000 Ohms, or less.

is the radio is set to vox also..... I beleive the d104 vox circuit only bypasses having to use the ptt, so the radio still has be set as well.

how is hte battery in the d104 (is it an amplified mike), is it a high impedence mike?? it may just NOT be driving the audio circuit enough for vox to trigger

try a different mike

Thankyou but doesn't the VOX only work when the front switch in flipped up and put in VOX position ??? Thats my guess ??? I'll try your suggestion of turning the VOX off on the side screws.

As for the relay I put some deoxit on the reeds of the relays and it seemed ok. They didn't look that dirty to begin with. I have also noticed a relay chattering in side the rig that I can hear and sometimes the rig seems slightly keyed up and I can see it in the S-meter and the recieve seems faint. With a tap on the side the S-meter drops and I get full recieve agin....

Thanks

Most D-104's I've seen only connect the mic element and/or amplifier with the PTT switch when pressed. For VOX, you will have to rig a way to turn on the amplifier when using it for VOX with the radio. Normally the amplifier only gets power when the PTT is pressed.

It's been a very long time ago, but my 104 works VOX with my TR-4 with no trouble. Seems I looked at the bottom and there was a schematic to follow. I think I moved one wire and used a jumper between two terminals. Look at the bottom plate, or do a search for Astatic: D-104.

Hope this helps

Yes, that's right.

>Thats my guess ??? I'll try your suggestion of turning the VOX off on the side screws.

If the 520's VOX is turned OFF, the only way the relays can be energized is by the PTT or SEND switch. If the MODE switch is set to CW and the CW key is closed (pressed), a CW side tone will be heard in the speaker but the relays will not energize. If the VOX switch is turned OFF, the side panel controls (VOX GAIN, VOX DELAY, and ANTI VOX) have no affect.

There are "2" relays in the 520, RL1 and RL2.

RL1 is located on the top left rear below the VOX UNIT. RL1 primarily controls the overall circuit switching and voltage control between receive and transmit.

RL2 is located under a small metal enclosure below the final unit between the rear panel and the larger metal enclosure. RL2 primarily controls the antenna change over as well as controlling the X-verter.

Both relays are controlled by the VOX UNIT.

You said one of the relay's is "chattering" and tapping on the cabinet stops the chattering. It is quite possible the VOX UNIT board may be causing the chattering due to a loose/bad ground on the VOX UNIT board. Try tightening all of the PC board mounting screws.

As for the "slow receiver recovery" from transmit to receive, even after the relay resets properly, the next time this happens, turn the AGC switch to "FAST" or "OFF" postion. If the receiver rapidly recovers, then is quite possible a resistor in the receiver's AGC slow decay circuit has changed (increased) value resulting in an increase in decay time. Further testing and checking of the receiver's AGC circuit will be required to determine if this is the case and which component is failing.

Check all PC board mounting screws to ensure they are tight. If the screw is tight, loosen it one turn then tighten. Do the same with chassis ground screws.

Dan, Don't spray anything between relay contacts ! Either use the special file made for pinball repairmen (yes, that's true, there are lots of moving contacts in those machines) or a rough cardboard, or VERY VERY FINE GRADE sandpaper, 800 or best 1200 grade, this in a last resort. Apply some pressure on the armature supporting the blades to clean those normally open. Hope this helps - 73's, Daniel, ON5PY

I have been told not to use sandpaper at all. Instead its recommended that you use a piece of cardboard (like business card stock) or a plain brown grocery bag cut into strips to run thru the contacts with some slight pressure.

I need to have someone explain how to properly use VOX. I've tried and tried and cannot get it adjusted correctly. It is either so sensitive that my breathing sets it off or putting a pencil down on the table sets it off or so insensitive that it misses the first syllable before activating.

It's a real PIA and consequently I don't even bother with it anymore.

I tend to operate in a not-terribly-quiet room, so I use a fist mike
(MC-10) and leave the VOX off. It's useful for operating PSK or RTTY,
because it saves having to wire up a PTT line interface.

Hi Dick. What kind of mic are you using? If its an amplified mic I am not too surprised. You need a really quiet room. The amplified D-104 mics seem to be especially sensitive to the slightest sound. The best advice I can give you is to try setting the gain control on the mic almost off, and adjust the mic gain on the radio. VOX operation can be problematical. You must be careful not to get into the bad habit of saying ahhh, ohhh, ummm, etc...to keep the radio keyed when you want to pause longer than the VOX delay. Also, sounds in the room keying the radio is not uncommon. If you choose to use VOX (I don't recommend it) you should keep the VOX switch turned off when not actually making a QSO.

The only time I use VOX is ti key the radio when using digital modes like PSK-31.

i copied the instructions from the manual, enlarged it, read it many many times, and still read it when needed.. it is tacked under the radio.

I does take time to learn, dont expect to be an expert the first day, remember we are not expert, we are amateurs, hi hi

check also the files area and know hybrid website, there are lots that can help

Hi dead easy once you have done it couple of times switch band to frequency desired i always peak drive control to maximum recieve first i leave the load control at about 11 o clock set meter to rf power switch to tune dip plate on key up to obtain peak power ,then dip the ip . thats enough to get useful power you can then play around fine tuning if you want to and thats it .hope that helps .

Maybe this will help. This is what I use for my TS-820, but most of it should apply to your 520. The Bias setting MAY be different, but it should be stated in your manual. I hope the formatting comes through.

Mode Switch
Meter Switch
Stand-By Switch
Procedure

USB or LSB
IP
Send
Adjust Bias control to 60 ma. (Usually you only have to do this once, then you will do 3 steps below on each tune up session)

TUN
ALC
Send
Peak the ALC reading with the DRIVE Control

TUN
IP
Send
Quickly adjust the PLATE Control to minimum meter reading (Dipping the meter)

CW
RF
Send
Peak RF Output by alternately adjusting the PLATE and LOAD Controls

Best of luck

73 de K5LCL

Hi Dick. What kind of mic are you using? If its an amplified mic I am not too surprised. You need a really quiet room. The amplified D-104 mics seem to be especially sensitive to the slightest sound. The best advice I can give you is to try setting the gain control on the mic almost off, and adjust the mic gain on the radio. VOX operation can be problematical. You must be careful not to get into the bad habit of saying ahhh, ohhh, ummm, etc...to keep the radio keyed when you want to pause longer than the VOX delay. Also, sounds in the room keying the radio is not uncommon. If you choose to use VOX (I don't recommend it) you should keep the VOX switch turned off when not actually making a QSO.

The only time I use VOX is ti key the radio when using digital modes like PSK-31.

Don't forget that the LOAD control (and to a lesser extent PLATE) will be affected by the load on the transmitter. Before long you get a feel for where the controls need to be for a "good start" on tuning up, just needing a quick tweak to bring them properly into tune. If you switch aerials, the loading may well be different. It shouldn't be but it is ;-)

If you've ever driven a car with a manual choke, it's a bit like that - before long you get to know exactly how much choke and where the throttle needs to be to start in any given conditions.

Hmmm... Tuning up into a dummy load is going to allow me to then switch over to my 600 ohm non-resonant, random antenna and have a matched system? I don't think so, I'll still have to tune to the actual antenna system.

Tuning into the dummy load only applies to a situation where the dummy load and antenna systen present the same load to the transmitter. This happens very rarely so tuning into a dummy load each time can be counterproductive.

You can however tune into a dummy load to get your transmitter set up for a 50 ohm load (if that is what you desire) then you can prune the antenna, add a BALUN etc to match those conditions as best as possible. If this is done, the antenna system would be a better match to the 50 ohm dummy load settings and again, tuning into the dummy load would be an un-necessary step.

The best reason for tuning into a dummy load is to keep the bands clear of un-identified carrier transmissions that may be interfering with QSO's or other communications already in progress.

For tuning a vacuum tube final...

While monitoring IP, check the idle bias current and peak the drive, then dip the plate, increase the loading then repeat the (dip-load) process until you get the plate current you want.

As you increase the loading, the plate dip becomes shallower, the dip will occur at a higher value and will become harder to define. You want to end up with a noticable dip at the recommended Plate Current.

If you do not get to the recommended IP value AT THE DIP using the plate tune and loading controls, the drive is insufficient or the final tubes are losing the ability to amplify the RF signal at the operating frequency (they are going soft or possibly, RF Final circuit components are geting old and changing value).

From: Greg Anders
Topic: 22357 Message: 22372

For what it is worth.

In the case of a system with a vacuum tubed final running thru a tuner to any antenna, I always want to set up my tuner to present a 50 ohm load to my transceiver before ever tuning my finals.

Why? Because if you put stress on your finals (6146's or sweep tubes) if you take 2-3 minutes tuning the tuner to present a 50 ohm load to the transceiver using the finals and your SWR bridge.

My solution is to switch into the stream my good old MFJ 259 antenna analyzer betwwn my tuner and rig. I set the band/freq on my analyzer and twiddle my tuner knobs till I get 1:1 and 50 ohms. No carrier on the air (nobody gets pissed) and no wear on my finals.

Then I switch back to the radio and fine tune my finals (dip and load) for 100W.

The MFJ sits on the table and is permanently plugged into a coax switch so I can adjust it and then select the transceiver of choice.

FYI,

Greg

22373. Question abt 599D twins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-10 18:19:15 UTC
From: medical35
Topic: 22373 Message: 22373

Hello,
I have the 599D twins on the way and want to be ready for them.
My question is about the antenna interconnect cable. NOT the sixteen pin cable. I know it has that.
I don't think it has the antenna interconnect cable. Or at least that's what most people call it.
My question is this: Can I just use an RG8X or RG 58 coax cable jumper with a pl 259 on one end and a motorola plug on the other end?
That's all it looks like it is to me.
On the back of the RCVR in the pictures it looks like an so 239 and on the back of the XMITER it looks like a motorola plug. Is that correct?
Thank you for your help,
Jim - K4KOR

22374. Re: [TS-520_820_530_830] Question abt 599D twins

Yahoo group: TS-520_820_530_830 (2009)

From: Jim Stanicek
Topic: 22373 Message: 22374

Do you have the manuals for the twins, or are you getting them with the radios?

The transmitter appears to have a separate jack for the receiver, so they can be used in a transceiver mode. I am not sure that the jack is a "motorola" type or a more common RCA jack, as I have not had a close look at my newly arrived twins, yet, myself.

However, the instruction manual calls it a "single pin jack" and the receiver itself has a SO-239 jack which is to be linked to that receiver jack on the transmitter.

I wouldn't think you would have any problem whatsoever with either 50 or 75 ohm coax and the proper connector (either Motorola or RCA on one end, and a PL-259 on the other). The cable is not really all that critical, since you are feeding a receiver with the T/R mute relay inside the transmitter !

I am just putting some pilot lights in my radios, as the receiver is totally dark. Got them from Mouser.

In fact, if we need help from one another or other owners of the twins, this is a great group to be a member of.

73 for now, let me know of your progress.

Jim AG3Y

On the back of the RCVR in the pictures it looks like an so 239 and on the back of the XMITER it looks like a motorola plug. Is that correct?

22375. Kenwood TL-922 Band Switch

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-10 23:24:09 UTC
From: n6wk_skcc3
Topic: 22375 Message: 22375

I have a TL-922 here that has a burnt Band switch. I think it is repairable if I can find someone to sell me their old burnt band switch that I can use for parts.
Does anyone have an Old discarded burnt TL-922 band switch to sell?
Or even a good used one?
Thanks,
Gordon

Hello,

Can't get any ALC meter action when switched to tune mode with meter selection on ALC. Can get ALC with SG switch turned off. Meter pegs to left when meter switch is in IP. Replaced tubes,still same thing. Service manual says to check Q5 2SC1515 on RF board. What voltages should I check for on Q5? Also to check finals for no dip in IP. Screen grid resitors possibly? Haven't checked them yet.

I was tunning on 20 meters when problem occurd. SWR was 6:1 was trying to get it down for only a few moments when I got a small pop noise and lights dimed on rig for a moment. No smoke smell or burning. Then everything seemed normal except for symptoms above. Please advise.

What else should I check.

Thanks for any assistance.

Hi Mike,

Things got busy around here. Roger on all. I've pulled one leg of D12 on the rectifier board, and tested. It's good. Also SG switch is in the ON position. I'm starting to feel the discouragement creep in. I was hoping this would be easy, and it's not looking that way anymore. Darned if I know what I did to it! I'll continue poking around.

Thanks for sticking with me!

Actually not if you do things correctly. Your antenna system should
be set up to present a 50 ohm load to the transceiver, as that is what
the transceiver is designed for. You can use a balun, or a tuner.
>

No, tuning into the dummy load IS ALWAYS a necessary step, for just
the reason you give in the next paragraph.

Tripp,

The "popping" sound you heard was R2 and R3 on the bottom of the final unit burning "open". Both resistors are 10 ohms 1 watt each and are wired in parallel resulting in a total cathode resistor value of 5 ohms. Replace both resistors with new 10 ohm 1 watt resistors.

Do not increase the wattage of R2 and R3.

Evening Jerry,

It's quite obvious something appears to have short circuited the 12VDC supply for Q34 to be destroyed (crumbled in your hands). I doubt Q30 is bad, although checking it would be a good idea. Q30 is the same as Q34, both are 2SA473Ys.

Since you can get the 2SA473 rather easily and at a low cost, I would pick up a few, 3 or 4, from the source I provide you in the last response. I also would replace D26, 9 volt zener, as well. Any 500ma or higher rated 9 volt zener will work as a replacement for D26.

However, before replacing any component(s), I recommend tracing the 12VDC supply lines, looking for any short that would have caused Q34 to be destroyed.

Evening Mike,

My thoughts exactly. I have 4 of the 2SA473 on the way. And I'm thinking of purchasing the full electrolitic cap kit availible on e-bay. I might as well swap out all the filter caps on ALL the supplys in the rig. I already have the HV cap kit from Ken. I'll see about picking up the zener (D26) too.

I'm pretty sure the only way to properly test Q30 is to pull it, and I'll do this. Next, I'm thinking of pulling that un-numbered test point on the 12.5vdc buss off the board. It has the three wires going out to other points on the rig (counter, rf board, rectifier board, etc). Then selectivly check each line. This will also tell me if the short is really on the AF board, even if I don't see how it could be. At least this is what I'm thinking. And I agree, no parts replaced until the short is located. Time for more shopping. :>)

Thanks again.

Fixed crystals as long as the net doesn't have to shift due to QRM will work, but if they have to shift a few Khz then you have to tune anyway.

Hi,
Well, there should be no discution about the dummy load tuning procedure.
My actual setup is a vertical 30 feet antenna up to 86 feet over groud on a metal roof, a Yaesu TRx FT-902, a Drake MN-75 tuner or an LDG Z11 Pro auto tuner.
I made a table with the loading position for max out in a 50 ohms dummy load, and I put also the MN-75 tune postion for each bands, so once done, it take me less than 10 s to change band with the manual tuner. With the Z11 it is faster once the PA is dipped and loaded.
I do not see how tuning in a 50 dummy load will able you to use a 600 ohms antena!!!
How can you do that?
I would like to know the trick!!!
73 good day!

So, how do you tune up the tuner, without transmitting through the
aerial?

How does tuning up the tuner differ from tuning up the PA?

I think what Martin is trying to say is by tuning into a dummy load your load/tune/drive controls will always end up adjusted to around the same point for a given band. Once you've done that you can use the tuner to match your aerial to what looks like 50 ohms (something like a constant) when you look back into the transmitter. IF your aerial stays the same AND your transmitter adjustments are repeatable AND you use the same tuner whose settings are also repeatable you can draw up a table of settings that allows you to quickly adjust your equipment for a given band or frequency. At some point you must put your radio on the air to confirm that your settings are correct and your VSWR is within acceptable limits but hopefully the need to tune up on air should be greatly minimized.

I've tried Martins method and it does lead to more repeatable settings in the radio and tuner but it's never exactly right. I still need to get some RF up the aerial and fiddle either the transmitter settings or the tuner settings to get it right. I'm sure this method would work much better if my one and only aerial presented the same load to my radio on all bands and frequencies but in reality it doesn't and I'm sure many of us are in the same boat. Robert asked how it will help with his 600 ohm aerial. Well it will if there is a tuner in between the transmitter and the aerial.

Martin's point is to minimize interference that tuning up on air may cause to others. His method helps to achieve this objective.

The receive jack on the back of the T-599D transmitter is called a RCA or phono type jack. Since the run between receiver and transmitter is generally short, you can use just about any shielded cable to interconnect. I used an old cable that use to connect one channel of a Hi-Fi tuner to one channel of a stereo amplifier. I just chopped off one end and added a PL-259 to mate with the receiver SO-239 jack.

Pete, Jim,

What I did was to use an extra piece of RG8X. I soldered an RCA plug on one side and a PL259 on the other. Works great.

Hello Jojo,

Fixed crystal operation replaces the VFO and depends on the FUNCTION switch setting along with the FIX CH switch setting on the front panel. The following is an explanation of each fixed crystal FUNCTION switch settings:

VFO-R

This setting, the fixed crystal controls the transmit frequency and the VFO controls the receive frequency.

FIX-R

This setting, the fixed crystal controls the receive frequency and the VFO controls the transmit frequency.

FIX

This setting, both transmit AND receive frequency is controlled by the crystal. The VFO is not used.

The formula for calculating the frequency of a fixed crystal is as follows:

LSB

5.5015 + x - operating frequency

USB

5.4985 + x - operating frequency

CW
5.5 + x - operating frequency

"x" is the band switch setting. For example, 3.5 for 80 meters, 7 for 40 meters and so on.

The crystal holder is HC-25/U

The fixed crystal will operate on ALL bands. The formula to determine what frequency a specific crystal will operate on, say, 20 meters USB is as follows:

USB on 20 meters

5.4985 + 14 - <crystal frequency> = operating frequency. The number "14" in the formula, again, is the 20 meter band switch setting.

Each FIX CH AVR crystal socket is labeled and each crystal socket has a trimmer. The trimmers for each crystal socket are as follows:

Fixed crystal socket 1, the trimmer is TC1

Fixed crystal socket 2, the trimmer is TC2

Fixed crystal socket 3, the trimmer is TC3

Fixed crystal socket 4, the trimmer is TC4

To "net", or move the crystal frequency by a "limited" range, adjust the individual crystal socket trimmer.

These and other operating details are clearly outlined in the 520 operating manual. If you do not have the operating manual, you can download the operator's manual, free, at the following website:

http://www.n6wk.com/kenwood/

Scroll down to the appropriate 520 link and click the link to download the manual.

Mike,

Thank you so much. That is exactly what I was looking for. For some reason, I did not see the section of the formula in the manual. But, thank you so much.

73,

jojo

From: Greg Anders
Topic: 22357 Message: 22392

Gordon asked,

So, how do you tune up the tuner, without transmitting through the
aerial?

In my reply yesterday I described my "zero-power" tuning procedure using my MFJ SWR analyzer (259) switched in line with the tuner instead of my transceiver/transmitter. Just set your band frequency on the MFJ and adjust the tuner for 50ohms +/- 0j. Its especially useful when I put up a new antenna and have no idea where to set the tuner. The MFJ with the tuner allows plenty of time to figure it out without any worry of flattening out finals or radiating QRM on the bands.

BTW, the other advantage of having an SWR analyzer handy each time you tune up is that IF you are using a T-match tuner you can hit 50ohms +/- zero with a low/no SWR. If you only use an SWR meter, T-tuners can be tuned to low SWR with several different control settings. The one you choose may not be the right one.

FYI,

Greg

So, how do you tune up the tuner, without transmitting through the aerial?

How does tuning up the tuner differ from tuning up the PA?

At this point in the sunspot cycle there is so little QRM on the bands and seemingly nobody on some of the bands. If they are all really there and just tuning into their dummy loads then we just assume that the band is dead...

I'd prefer to hear someone tuning up on 15 or 6 meters than listen to a quiet band and assume there is no propagation... (I do realize there are 6 meter beacons). If I hear someone tuning up, I get ready to pounce on them for a QSO... Hi Hi

Hi Ken. Well, if everyone just listens, then the band may be presumed
to be dead. Someone has to put out a few CQ calls. :^))

In the absence of an antenna analyzer, then yes you must transmit into
the antenna through the tuner. I have (as others here have also) a
chart of the tuner settings for specific frequencies on each band. So
as long as the antenna has no problems, it takes maybe 2-3 very short
transmissions to set up my tuner. The point of using a dummy load is:

1-Minimize interference to ongoing QSOs that you may not hear.
2-Make sure that the transmitter is tuned properly for the 50 ohm load
it is designed for.

To use an antenna fed with 600 ohm feed line, a 12:1 balun is probably
the best solution.

Hey Mike,

Guess what, your diagnoses was dead on the money. Check with DVM shows an open on the 10 ohm resitors. The other resistors read normal. I will replace them and should be back on the air.
Thanks for the the advice which saved a lot of time.

Yes, but you'll have to find room for it... TS-520's quartz is a small wire-connected HC-49U or similar, the one for the SB rigs is big size HC-6U. Otherwise the frequency sheme is exactly the same for both rigs, and also for TS-511 or TS-515 and TS-510.

Hi Roland. What mic are you using? Did it come with the radio? You may want to try a known good high impedance mic and see if that cures the problem. While I have not seen it very often, dynamic mic elements can be damaged by being dropped or knocked around. In any case, my first suspect would be the mic unless you are using a known good high impedance mic that works fine on another radio.

From: danadak
Topic: 22406 Message: 22406

Hi, just got a fix-er-upper-er. Any assistance greatly appreciated.

20M, recieve incredliby faint/weak. Where is the PD board ? Is that under the VFO board. Looks like a major diassembly effort to get at band xtals. Which is what I suspect.

Display, got it mostly working but have had two issues with it :

1) Intermittantly got into a mode where f displayed was one Mhz high ?
Happened twice, cycled power, that did not fix. But today issue gone away.

2) I get wacky digit flicker, never the LSD's, always 100 Khz and 10 Khz digits. Any ideas ?

Regards, Dana.

Hi Dana. The first thing I would do is to losen and tighten all the circuit board mounting screws. Then clean all the switches and controls with DeOxit D5. Then check to see that all of the connectors on the boards are making good contact, and that the connector pins on the boards are not loose. Check the display board for bad solder joints if the suggestions above do not fix that problem.

Good Luck!

Dana,

You did not specify which radio you have. Which Kenwood hybrid model do you have (520/520S/520SE, 820/820S, 530S, 830S)?

Topic: 22404 Message: 22409

Aloha Martin,
I was told by the owner before he gave it to me that was the problem.
I plugged the radio in and turned it on and saw that it also had poor RX recption also. I did a little reading on this groups messages concerning the 530 and I think I found the problem. The Band Swtich had a cracked coupling in the RF cage I changed it out with the one on the Load control since it was exactly the same less the crack. I now have good RX and I am going to test it out in a couple of minutes
and monitor it on my TS-850 and see if that indeed was the problem.
I do not know what mic he was using but I did get a MC-50 with the other 530 I picked up yesterday. I have owned 3 520's a 530 and a 830 in the past and really like them.

22410. TS530S no power or receive on certain bands

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-13 23:01:25 UTC
From: k4qo
Topic: 22410 Message: 22410

Guys,

I have TS530S that doesn't work on 20, 17, and 10 meters. (no power out - very weak receive)

It works normally on 160, 80, 40, 30, and 12 meters.

Anyone see something like this before? I've checked the VCO's and they are working within the ranges. I suspect something that is common to the three bands, but I can't seem to find that.

I'll be poking around on the band switch tonite. I'll let you know if I find anything there.

Thanks in advance!

73,
Randy
K4QO

Ok now after some on air checks of both 530's this one still has rough audio using the same mic as the other 530 that has clean audio. But I must say that it does have the same output power of 120W. There must be something in the TX audio line that is causing this. This problem was confirmed with another Ham 1 had rough audio and the other had clean audio with the same mic. I would like any input if anyone has had this problem in the past.
Thanks

Hi Roland. I hope that was the only problem. Ken, K4EAA sells couplers. I replaced the very same coupler in my TS-530S, as it was cracked, but had not failed yet. The metal one that I got from Ken is really nice, and was not hard to install. Make sure to make note of the positions of both shafts when replacing the couplers!

The MC-50 is a great mic! I have one here, and it gets me unsolicited praise for my TX audio on my TS-530S, my TS-130SE, and my TS-430s (using a home-made 4-8 pin adapter). I have the Kenwood MC-42 for the TS-430S, and the MC-30 for the TS-13-SE (also works on the TS-530S). The Kenwood hand mics sound good, but thoise I have talked to agree that the MC-50 sounds better.

I am assuming the IP meter reading is uncontrollable, full scale, in transmit. If that is the case, it appears the bias supply, -C on the Rectifier Unit, has failed.

I don't have a source for final amplifier RFC replacement other than a parts radio.

Contact the seller on Ebay, he sells paints regularly. I bought the Kenwood paint for my 520SE from him.
You can find him by searching the ham radio section using the term "paint".... He sells paints for lots of old rigs.

Thank you for the suggestions. I went to the k4eaa website and he has a suggestion that the plate choke can be rewound. Since it is a straight one layer winding, that is probably not hard to do. I have to figure out what guage enameled wire this is, does anyone have an idea? Also my old choke no longer has the correct number of turns so I need to know how many turns to wind. I suppose I can work backward from the inductance to find the number of turns.

22422. Anyone own a TS-900S?

Hi,

I know this group isn't specifically set up to cover other vintage Kenwood's but I thought I would ask anyway.
I just received a TS-900S and would be interested in conversing "off-line" with anyone out there who has one.
It's an interesting unit to say the least. I would say it's the Transceiver that looks like the Kenwood Twins....

Thanks,

Greg

22425. Re: VFO-230 in Tune Mode

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-14 17:23:22 UTC
From: ka1wpm
Topic: 22355 Message: 22425

I heard from another member off-line that this is not correct behavior. So here are the complete symptoms:

With the VFO-230 set to VFO mode, everything works fine except if the TS-830S is set to TUNE. Under these circumstances, the display on the TS-830S blanks, indicating a loss of lock. This happens on all bands except 3.5. On 3.5 MHz, the rig displays 3.0000 and doesn't change when the external oscillator is varied.

In all cases, the display on the VFO-230 works as it should. On 3.5 MHz and 24.5 MHz, 500 kHz is added to the VFO-230 display like it should be.

So my question now is, what could happen when the rig is placed in tune mode that would make it behave this way while using the external oscillator.

22427. USB & LSB passbands sound different, how to make them sound alike?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-14 20:04:59 UTC
From: marcus_leatham
Topic: 22427 Message: 22427

Hi,

This is about my R-599. I believe there is no group for the R-599 so I'm inquiring here. LSB has a lot of bass. USB has a lot of treble. They should sound the same. It looks like both modes use the same filter. The only adjustments I can find are for the BFO xtal trimmers. If I adjust the BFO frequency, will it change the sound of the passband? If so, is there enough adjustment to correct it? The IF circuits (BFO xtal oscillators) are in a sealed can that would be difficult to open for testing, but I have a decent oscilloscope and frequency counter if necessary. Also, there are some adjustments on the filter board, but the actual filter (I believe but I could be wrong) is an xtal lattice type. Thanks in advance for any advice.

It's the BFO that is out of alignment for LSB/USB. The different pitch for USB and LSB should be fixable. The BFO circuit should show you each of the three crystals (one for CW,USB and LSB). If there is a padder trimmer on each then you could set them to the proper frequency with a freq. counter. I don't own a 599 so I don't have a schematic or manual. If you have the manual there may be a section on alignment of BFO frequencies which I would follow if I were you. I've done this exercise on dozens of Kenwoods. Not complicated.

Greg

Subject: [TS-520_820_530_830] USB & LSB passbands sound different, how to make them sound alike?

Hi,

This is about my R-599. I believe there is no group for the R-599 so I'm inquiring here. LSB has a lot of bass. USB has a lot of treble. They should sound the same. It looks like both modes use the same filter. The only adjustments I can find are for the BFO xtal trimmers. If I adjust the BFO frequency, will it change the sound of the passband? If so, is there enough adjustment to correct it? The IF circuits (BFO xtal oscillators) are in a sealed can that would be difficult to open for testing, but I have a decent oscilloscope and frequency counter if necessary. Also, there are some adjustments on the filter board, but the actual filter (I believe but I could be wrong) is an xtal lattice type. Thanks in advance for any advice.

I have a Kenwood 940SAT. When I hit the LSB compared to the USB, yes, there is a difference in the audio like you say, but I am not about to go through a rig that is receiving just fine and change it. My receiver is setting at .12 sensitivity. I will leave it alone especially if the coils are sealed. Fat chance they got changed. Brad KB2CHY

It's the BFO that is out of alignment for LSB/USB. The different pitch for USB and LSB should be fixable. The BFO circuit should show you each of the three crystals (one for CW,USB and LSB). If there is a padder trimmer on each then you could set them to the proper frequency with a freq. counter. I don't own a 599 so I don't have a schematic or manual. If you have the manual there may be a section on alignment of BFO frequencies which I would follow if I were you. I've done this exercise on dozens of Kenwoods. Not complicated.

The 940 is a different animal. That BFO is tied into the PLL frequency synthesizer. It still can be adjusted for proper audio response but the process is different. In some PLL radios like my Yaesu FT-1000D you actually have to adjust the master oscillator frequency to spec first, then you can twiddle the USB/LSB carriers. If the master oscillator is what is off frequency slightly you won't be able to adjust the USB/LSB to sound right.

FYI,

Greg

Hi Marcus,

I am having exactly the same problem with my R-599, and it appears that the problem is with the "carrier insertion point" in the "Carrier Unit UC 1214J which is located just in front of the power transformer in left rear corner of the receiver.

The frequencies of the crystals are supposed to be 3393.5 , 3396.5 and 3395.6 Khz.

I found my USB crystal to be 600 hz high at the lowest frequency I could trim it to before it dropped out of oscillation.

Ken Kemski gratiously sent me this information, which I will pass on to you.

I have further comments below Ken's information which starts on the next line:

Yes, when it's moved in frequency it's changed mechanically somehow, and the series R is probably higher also. They don't oscillate well, and if you try to pull them they just stop.

It should be an HC-6 with wire leads. I mostly see them in the 520's, as I've only worked on a half-dozen or so 599's so I presume they are the same as the 520.

The last one I got from Jan (about a year ago) was also a little high in frequency. I had to pad the series C to be able to tune it in. You might point out to Jan that there is about 10pf across the crystal and 22pf in series with it in the Kenwood circuit. They can then get it right on (as they should, for what they charge!).

Great Luck,
Best 73's,
Ken

k4eaa.com

Some handy links:

K4EAA Home
Kenwood FAQ
Tune-up Guide
Parts Sales
Printable Packing Slip

Packing Instructions

I believe that the resistors he is referring to are each 10Kohm and are designated R1 R2 and R3, and are located between the connectons to the main circuit board, and one side of L2 L3 and L4.

I am going to check the values of those resistors before I send off to JAN for some rather expensive rocks !

Good luck! Keep in touch , via this forum, and I will do the same.

My e-mail is

jimstan@..., but it would be nice if we can keep the discussion going on the public forum. Look for earlier posts about the 599 or "GoldDust Twins" and you will find quite a few !

73, Jim

Dana,

The PD UNIT is one of 2 PC boards inside the PLL UNIT metal enclosure.

The PLL UNIT is on the bottom of the 820 chassis.

I recommend removing all 3 of the metal enclosures (one at a time), PLL UNIT, CARRIER ASSY UNIT, and COUNTER ASSY UNIT then clean each set of fixed pins and pc board sockets inside the metal enclosures. This may seem a lot to do but considering the age of the 820 and the different environments it has been subjected to, the pins and sockets can become dirty and corroded creating all sorts of problems.

I also recommend cleaning the FUNCTION, BAND, and MODE rotary switches. Don't forget the switch wafer inside the final amplifier cage.

If you do not have the operator and service manuals, you can download them from n6wk's website:

http://www.n6wk.com/kenwood/

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-15 22:46:48 UTC
From: Greg Anders
Topic: 22410 Message: 22442

The previous posting may have some bearing on this problem.
The 530 is from the "era" when the WARC bands were being implemented and released for use by Hams. Until the bands were fully released for use the radios shipped with jumpers to prevent use on those bands. This may be your problem,
All I remember was that 30 meters opened first, the others were later.

Hi Guys. It doesn't sound like the W.A.R.C. bands being enabled or not has anything to do with this problem. If the W.A.R.C. bands are not enabled, that means you can't transmit on 30M, 17M, and 12m. The radio will still receive on those bands. and that has nothing to do with 20M and 10m. Most likely this is a band-switch or alignment issue, or the crystals for those bands my be bad.

My TS-530S does not have the W.A.R.C. mod done. It will receive on all HF bands, but will not transmit on 17M and 12M. 30M is enabled.

Disabled WARC bands is not the source/cause of the problem.

Randy, you didn't state whether you are the original owner or not. If you are not the original owner then I would no discount the possibility that a previous owner took out their golden screw driver and soldering pencil to performed some adjustments/changes/modification that resulted in the problems you are experiencing on 20, 17, and 10 meters. It's possible a previous owner may also have tried to modify the 530 so it would operate on 11 meters and made a mess of things. Wouldn't be the first time something like this has happened.

I suspect the source of the problem is a failure in the PLL UNIT.

I recommend going through each alignment step starting on page 33 of the 530's service manual.

Mike,

I think you are right - and after poking around on the bandswitch helping some of the contacts make continuity, I temporarily got 17 meters to work. At this point I have to agree that the bandswitch is probably the culprit.

Its history is known... so I'm not ready to look for Golden Screwdriver marks just yet... Looks to me like the previous owner did copious amounts of contact cleaner some time ago before putting it up on a shelf for several years. It was given to a local here and I am helping him sort it out.

Thanks for all the help and tips! The WARC band thing caught my eye early on but that had been done already. Wish it was that simple! hi!

22448. Extra filter

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-16 22:36:27 UTC
From: wrench101
Topic: 22448 Message: 22448

Hello all. I picked up an 820 a few weeks ago and have been working through some of the bugs it has. I've lubed and cleaned the stiff VFO, replaced the VFO lamp,and have tried to figure out the display issues. It has the DG-1 display option installed and looks like it has seen some service in the past. The contacts between the two pc boards have been cleaned which helped, but it seems that, according to info I've found on the web, this unit has cold solder problems. Any suggestions? The biggest concern I have is that an extra filter has been wired to the rig for receive and transmit. It surely takes away from the rich sound I'm used to hearing from these rigs. Can anyone tell me if it is difficult to remove this filter and return the rig to its original sound? The filter itself is mounted on top of the large capacitors nearby and wired with what appears to be some small coax. Would simply de-soldering the filter do the trick? I can provide a pic if needed. Thanks in advance. 73 AI4NV

Hi. Looking at the manual, the TS-820(S)is capable of accepting an accessory CW filter. How many filters are in the radio? It should have a stock Kenwood SSB filter installed on the IF board. A look at the manual will show the position.

Is the filter that you are talking about the only filter in the radio? If so, someone may have replaced the stock Kenwood filter with a filter with a narrower bandwidth. If that is the case, you cannot simply remove the filter, it will have to be replaced with the stock Kenwood YG-88S SSB filter. If you can post a good pic to the file section, that might be helpful.

Topic: 22410 Message: 22450

Randy,

When I suspect a switch wafer, I use a magnifying glass and, while rotating the switch wafer, I look at the switch moving blade as it slides through the fixed contacts. If the fix contacts expand then the switch wafer is most likely good. This also assumes the switch contacts are not corroded.

However, if the fixed contacts do not expand then it is quite possible that fixed switch contact may not be making contact with the switches sliding blade. It could be bent or worn to the point the fixed contact is not making connection with the sliding blade.

The band switch wafer S1-1 controls the application of the band select control voltage (9VDC). This voltage is applied to the PLL UNIT through both Counter Unit's plug 4 to 3 then on to the PLL UNIT's plug 1. A failure in one or more switch contacts on switch S1-1 can affect the selection of one or more bands.

In transmit, the PLL UNIT's VCO signal is fed to the RF UNIT where it is mixed with the IF UNIT's "TIF" (Transmit Intermediate Frequency) signal in the dual transmit mixer Q6 and Q7 to produce the transmit operating frequency.

In receive, the same occurs but in reverse, the incoming signal mixes with the VCO signal in the dual receive mixer Q3 and Q4 to produce the "RIF" (Receive Intermediate Frequency) that is fed to the IF UNIT for signal processing.

If the PLL UNIT's VCO band selected signal that is fed to the RF UNIT and the VCO signal level is very low or non-existent for one or more bands, both transmit and receive functions will be affected. That means, if say, 17 meters VCO signal level is non-existent then 17 meter receive AND transmit will not work. You will hear receiver noise but there will be no signals heard and no RF output in transmit.

I have posted 2 pictures in the files section in a folder called TS820S Extra Filter. The rig has both the cw and the ssb filter installed on the circuit board and another filter wired to it from the back side and it is mounted on the caps as shown in the pictures. If memory serves me correctly, the previous owner said it was a fox tango filter that was wired for transmit and receive back in 1978. It appears as if I can just unsolder it from the board and return the filtering to normal. Again, any help is greatly appreciated. 73 AI4NV

The TS-820 and TS-820S came from the factory with a sideband filter only. The CW filter was optional.

It is difficult to determine what "extra" filter that has been installed in your 820's IF UNIT. If the stock factory sideband filter has been installed and is still present on the IF UNIT then you can remove the "other" filter but you will have to check and, if necessary, change the position of the IF UNIT's IF2 plug. See the 820's operating manual for details on inserting IF UNIT's IF2 plug.

If you do not have the 820 operating manual, you can download it from the following website (N6WK):

http://www.n6wk.com/kenwood/

See page 34 for details on installing optional filters and the setting of IF UNIT plug IF2.

One question. Is the "extra" or "other" filter installed in your 820 all silver and "square"? If so then it is most likely an INRAD filter. If it is an INRAD filter, what is written on the top of the filter? You can see INRAD's 820 filters at the following website:

http://www.qth.com/inrad/

INRAD filters are much better than the factory 820 filters.

Another thing that can affect the 820 in both transmit and receive is the PLL and CAR UNIT alignment.

I (W5RKL) said the following:

> It is difficult to determine what "extra" filter that has been
> installed in your 820's IF UNIT.

I missed the response stating the pictures of the filters were in the files section.

However, until you determine what the filter is used for I would not simply pull it out. It does not look like an INRAD filter.

What is written on the top of the filter?

Unfortunately, the filter is double side taped onto the caps (upside down for wiring purposes, hence, don't know what it is) and I don't want to damage the caps trying to pull it off. I used a little force and she wouldn't budge. I plan on taking it out of operation and leaving it where it sits for now. I'll (carefully) cut it off the caps later. Would there be any harm in desoldering it from the board and listening to it to see (hear) if it goes back to normal? 73 AI4NV

Topic: 22448 Message: 22458

Although I can't say for sure, it appears the previous owner has wired the extra filter in series with the CW filter. To do this, one end of the CW filter PC foil run would have to be cut. Look closely at the IF UNIT where the extra filter's coax cable connects to the IF UNIT CW filter terminal. Do you see a cut in the PC board foil?

Also, what changes, if any, occurs when changing modes?

What position is the IF UNIT's IF2 plug?

Filter selection is achieved by applying a bias voltage to the filter selecting diodes, D5 and D6 for sideband, D7 and D8 for CW. The IF UNIT plug "IF2" must also be set appropriately as outlined on page 34 of the 820's operator's manual.

You can simply disconnect the coax cable from one end of the extra filter. However, by doing so, you may, if the PC board foil on the IF UNIT is cut, loose receive and transmit in CW/TUNE MODE. If this happens, set IF UNIT plug IF2 to position "A" until you correct the modification/change the previous owner has done.

After looking more closely at the foil side picture you provided and the 820's IF UNIT schematic, it appears a modification has been made to the CW filter connections.

I can't say for sure but it does appear the previous owner has modified the filter connections to add the extra filter in series with the original filter. By doing this the CW mode will have a much tighter bandwidth when the mode switch is set to CW and TUNE. Of course this is assuming the IF UNIT's IF2 plug is set to position "B" as shown in the 820's operator's manual on page 34.

If this is, in fact, what has been done, simply remove both coax cable connections at the IF UNIT's foil side and install a jumper across the cut foil. A short piece of wire shaped to form a "U" with the ends of the wire at a 90 degree angle can be used as a jumper. Check your work to ensure there are no solder bridges that will produce a short where a short should not be.

You said you did not want to remove the extra filter since the double stick tape appears difficult to remove. You can, using care, use a knife and slice down the middle of the double stick tape to remove the extra filter.

To remove the tape from the capacitors simply hold the capacitors firmly in one hand while removing the tape with the other.

To remove the tape from the filter, use label remover. Check you local hardware or Walmart for label remover.

I suspect the extra filter is a Kenwood CW filter YC-88C. If it is and you also find the original CW filter to be bad, you can simply replace the bad filter with the extra filter.

Page 49 of the TS-820 Service Manual. Its available on mods.dk. You need a freq. counter. If adjustment to the specified frequencies listed for USB and LSB still produce a different sound (background noise), your crystal filter has aged and isn't symmetrical. In that case I just tweek the frequency slightly on the mode (lsb or usb) that has the higher pitch until it matches the other one. Make sure your IF shift is centered when doing these adjustments.

Simple.

I recently acquired a TS-820--my radio has the same symptom. It was
shipped to me, which easily can "upset" a radio, and I haven't learned
enough about the radio yet to want open it up, but I would like advice
on what it might be and how to get it set straight.

Saludos,

Scott (AA0AA)

I got my Trio TS-520D yesterday and oh boy what a great rig it is. Very clean and almost in a mint condition. :)

Finals seem to be working just fine and I can get out some 120W - not a bad deal. Great audio, both TX and TX and this even has 500Hz CW filter installed.

You can see the pic of it here http://oh7ps.com

Jason,

Yes, what tubes are in the final? If you have a manual for the 520D look there. If not, before opening up the final compartment be sure the radio is turned off, power plug pulled and you don't touch the plate caps or the resistors on the caps unless you short them to ground first. The 520S came with a pair of 6146 or S2001 tubes. The S-2001 was the Japanese 6146.
A pair of good 6146 tubes will put out 100-120W into a dummy load with the higher figure found on the low bands (80/40) and 80-90W on 10 meters.
If you have two good tubes you should get around 100-120W output on CW (the higher figure on lower bands) with around 220-230ma showing on the IP switch position (plate current). If the finals are weak it won't put out that much power.

I thought, like the TS-530D, the TS-520D only has one tube in the final.
So 70 watts is reasonable.

I am looking for cut traces or any other anomolies, but it sure looks like C9 is missing. Does this make sense? The previous owner stated that he had Fox Tango filters installed shortly after he bought in back in 1978. I'm still in the process of comparing the illustration in the service manual and the circuit board for any differences.

Hello All,

I don't know the TS-520D was introduced to the market other than in Japan,
TS-520D is 100W version of TS-520X (10W, vice versa).
I own an TS-520D and it has 2 final tubes installed.

Osamu

Does anyone know how to service a Simpson 260. I was given a series 7 and I am wondering how to check the meter section to see it is working or damaged. The series 5 that I have works fine but I am not sure if the meter itself is damaged. I know some of you fellows still use them. The only thing I really know to do try to test the meter seperately. I dont think the resistors are bad but I am checking them also. Does anyone know where to get parts? Gene

Looking at the foil side picture, it appears, although I can't say for sure, the extra filter is connected between the cathode end of D4 through a .01ufd (103) disc capacitor on the filter itself to the junction of C14 and R11, again, through a .01ufd (103) disc capacitor on the filter. The disc capacitors on the filter, 2 of them, are labled "103" which indicates a capacitance value of ".01ufd".

My recommendation is to remove the coax cable wiring on both foil side connections. If C9 has, in fact, been removed, install a new .01ufd disc capacitor, voltage rating of 25VDC to 50VDC will do fine. This will, at least, put the 820's IF UNIT back to it's original wiring design providing no other components have been removed.

I would then perform the IF UNIT alignment as outlined in the 820's service manual.

Hi Jason.
As pointed out in a earlyer post, the finals maybe going soft. but before replacing them try a new driver tube. my ts-520s was dropping off on the out put and new finals did not help much so i replaced the driver. what a differance.

Hi Gene,

Yes, the best way to start is to check the meter separately first. and that you can do with almost any Ohm meter, I have a couple that I still use don't remember the exact models but for sure I think I have the 7, these meters are very easy to fix as their circuitry still uses the basic metering circuit, and differences in the models are a few minor high and low scales.

Oh, you also down load the service and operating manuals I think still, will look for the site if you don't have it already, these are very accurate meter once no tampering was done.

v44kai.....Joel.

Remember also to make sure all the batteries are in, that's the only it will work on all the Ohm scales, don't need the batteries for voltage test, Oh and here is the Simpson web site. http://www.simpson260.com/ down load what you want, I think there is also a group. I hope this help.

v44kai.....Joel.

I dont think the resistors are bad but I am checking them also. Does anyone know where to get parts? Gene
>
Simpson still services these meters if in fact there is something wrong with it. The series 7 meters are workhorses and unless someone really abused it it should be ok. The best way to check it is to check known power sources such as a power supply and a 120V ac line. Also get a few 1% resistors and check it with them.
Good luck

22473. TS-820S Front Panel Lights

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-18 15:21:32 UTC
From: danadak
Topic: 22473 Message: 22473

In the service manual I do not see the portion of the schematic that covers power distribution in the 820S. My lights are out, no V at terminal strip they are connected to, so I am wondering if they are AC, or DC, and if any switch positions affect them, off or on.

22474. Re: TS-820S Front Panel Lights

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-18 21:24:51 UTC
From: w5rkl
Topic: 22473 Message: 22474

Look at the bottom middle of the 820 schematic that shows the AC Power Plug wiring. Notice a jumper between pins 7 and 10. Then, look to the right of the power transformer and notice the meter and dial lamps connect to pin "7" and the 12VAC secondary winding of the power transformer connects to pin "10". That's how the lamps obtain power.

The meter and dial lamps do not have a separate switch other than the main power switch. Once power is applied and the 820 main power switch is turned ON, the dial and meter lamps should light "IF" the lamps are good and the wire from pin 7 to the lamps is not broken/open. The tube filaments are also powered from the same 12VAC secondary winding BUT, notice that pin "7" on the rear panel power pins also goes to the HEATER switch S17-2. The schematic show the HEATER switch in the "OFF" position.

The lamps will work with either AC or DC, it doesn't matter.

impedance should be 500 to 1000 ohms and it should work just fine,rk56 is noise canceling so it knocks out background noise.excellent choice. 73 kc0rom Scott A. Litz

22480. Extremely Clean TS-520 Station FS

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-20 19:55:59 UTC
From: jmcgsd
Topic: 22480 Message: 22480

Kenwood TS-520 with VFO-520, SP-520 and MC-50. This is a classic, vintage station purchased from an SK estate. There is not a mark on any one of the components although they could use a bit of cleaning. It is complete with all original boxes, and the manual for the VFO-520. Not all of the original packaging material is in the boxes, but they are in excellent condition. I unwrapped this from 1978 copies of the San Diego Union newspaper, made some quick checks, plugged it in and signed on to my local California Net on 75 meters. Seems to work great except that I think there is a cold solder or loose solder joint in the cable from the Xcvr to the VFO. I notice that signal levels are lower when tuning with the VFO than with the Xcvr.

I am asking $475 plus $75 UPS Shipping in the Continental U.S. I can accept and prefer PayPal, otherwise U.S. Postal money order. You can pick it up locally in San Diego to save the shipping. I will consider a partial trade. I am especially QRP equiupment (Elecraft, OHR, MFJ, LDG Z11, etc), Vibroplex bugs other that the "standard" and other interesting equipment.

Please email me for picture at af6ni at arrl.net or call 619-840-8736.
Thanks.
Joe

Have not followed the whole discussion but had a look at the uploaded pictures. I would have left it alone since I think that you'll find that it is just an additional filter that has been added to increase the skirt and improve the spurious responses.

This is something that was done in my Tentec Omni too (very common in the early TenTec's). Basically a couple of filters get switched in series rather than having a single one. Has a major impact on reception of a weak station if there is a ham starting up with a powerfull signal close to where you are operating.

There may have been some other delicate changes to ensure these filters work properly together (e.g. matching the impedance, getting an extra amplifier stage in there).

22487. Question only a Newbie could ask

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-21 20:41:23 UTC
From: rylenfield
Topic: 22487 Message: 22487

New ham, new 520 owner. When I get it tuned up for a certain band and then turn the radio off, when I come back the next day do I need to retune it as long as I am in the same frequency range. I am guessing the answer is yes, but am not sure I understand why.

Also I bought a 520X for parts. Anyone know what market it was made for?
It is a 100v model.

22488. RE: [TS-520_820_530_830] Question only a Newbie could ask

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-21 21:37:59 UTC
From: Greg Anders
Topic: 22487 Message: 22488

If you come back the next day and transmit on the same band/frequency there is no need to retune. If you move frequencies >50-100khz you should "re-touch" the tuning but changes will not be drastic. The most important adjustment to have correctly set is the plate tuning. That should always be "dipped".... Large frequency excursions within a single band will also probably require that you re-adjust the drive tuning as that peaks the output of your 12BY7 driver tune.

Welcome to the crew, newbies have to learn somewhere and this is a good place.

Greg

Topic: 22096 Message: 22489

Today I got together with a local ham who is also a commercial radio repair technician. I brought the TS-830s to his shop where he has all the diagnostic equipment. He immediately knew something was amiss. He first fixed some cold solder joints. Still things were not right. He moves so fast I could not keep up. Ultimately he showed me that the R2, R3, and R5 resistors were junk with big pock marks out of their sides and corresponding brown spots on the board. He replaced all 4 resistors and then installed and neutralized the new 6146B's. Things worked out just fine. The tuner calibration was nuts on. He checked it on a few bands and then calibrated the S meter as well. That was about all the time we had for our after hours repairs. She's back working again! Thanks for everyone's help! 73 Peter.

22490. 6146 tubes in hybrids...a question...

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-22 01:42:43 UTC
From: Jeff E
Topic: 22490 Message: 22490

After reading about N6WK's good fortune (lucky duck, eh?), I started wondering about 6146 tubes in Kenwood hybrid rigs...

Given the experience of the operators within this group, which tubes have given you the "best" service?

6146's? ... 6146B's? ... 6146W's?

I'm just curious... Often, at the monthly Ham/computer "flea market", you find 6146's in various "flavors", & the price is right... Often, you'll hear, "I sold the rig that used them tubes... I never needed to change 'em out." ...

So, what say you, keepers of the tube-type faith ??

Thank you, gentlemen & ladies...

Good operating, & 73.

Jeff Easterly
La Mirada, CA

Jeff

it all depends what you mean with "best". If you do a search either in this group or with google you find many lenghty answers. In a nutshell rigs designed for the use of the 6146 / 6146A will become unstable when you put in the 6146B. The 6146W is the "ruggidized" version of either the 6146 / 6146 A or the 6146B depending on when it was manufactured.

Then there are also some remarks (e.g. www.rfparts.com) that do not recommend the 6146W from GE in a Kenwood rig.

For long life the W is advised, for the highest output the B version is best.

I have a little problem with my TS830M.
I seem to have lost the receive signal on AM, but the S meter is still
reacting to incoming signals which I cannot hear. According to the S meter the radio is receiving ok but I cannot hear anything. The radio is working perfectly on all other modes and bands. I have cleaned all the plugs on the little AM board and when I switch to AM mode the relay on the AM board drops out as it appears it should. I hope it is not the mode switch, I would not like to be trying to replace it. The radio was working on AM but I have just discovered that it is not working on AM mode now.

Thanks for reading.
Any help would be appreciated.

Marc

Hi Daniel,
Thanks for reply.
The mode switch is a completely sealed type, not like a wafer type switch, so I dont think this type of switch can be cleaned (I may be wrong) but I dont think so.

Marc.

Hi Marc,

I guess it could be with some contact spray - I had a 830 but cannot remember if I had to do this job.

But, before going to do it, do you hear anything when rotating the mode switch ? Have a closer ear when it is between stops. Try rotating it several times, slowly, and listen to what goes out the set.

For the electronic issues, I can only retrieved the diagram and give some ideas, not more. Maybe there is a 830 guru on the blog....

Last word : you said you hear the relay clicking. Relays too may go erratic with age and wear. If you can open it, you can try by applying some gentle pressure on the make contacts and see what happens.

Good luck & 73's - Daniel

I have just taken delivery of my new(?) TS830S. It appears to have a problem with the mode switch.
When I change between USB/LSB, RL1 on the AF board operates for about one second. This is compounded by a suspect dry joint on the same board, which is causing the meter to go to FSD.
Turn the radio on it's back and the meter deflection disappears, flex the AF board and it comes back in. I will pull the board out and check for a dry joint.
It is the operation of RLI when switching modes, I need some advice/help with.
Is this normal on the TS830S, It doesn't happen with my TS530S.

Hello Marc,

The AM UNIT is powered by 12VDC supplied from the AF UNIT's "12" terminal. Ensure 12VDC is present on the AM UNIT by measuring the voltage between plug 2 pin 3 and chassis ground. If there is no 12VDC on plug 2 pin 3 the AM UNIT will not function. Also check for 9VDC at the AM UNIT's AMS terminal. This voltage is only present with the MODE switch in AM.

I also recommend removing both AM UNIT plugs, give a shot of contact cleaner to both AM UNIT sets of pins then reconnect both plugs a few times.

Trace the signal from the IF UNIT to and through the AM UNIT then back to the IF UNIT.

If possible, clean the relay contacts of RL1 on the AM UNIT. A corroded connection can affect the signal as it flows through the AM UNIT, especially the output of Q2 that flows through RL1-2 to the AF UNIT.

Check the AM UNIT's mounting hardware to ensure they are tight.

I have a Johnson Viking Valiant that used the same set of three vanilla 6146's for over thirty years. And that was running 250W input on AM (130W continuous carrier output).
I have used both the 6146W and the GE 6146B. They both are very rugged tubes. If there is any distinction between them, the 6146W is a ruggedized vanilla 6146 with 25W plate dissipation. The 6146B is a re-design with larger plates that resulted in 35W dissipation. However, the 6146B has very different inter-electrode capacitance so it cannot be neutralized in some older rigs that were designed before the 6146B was available ~1969.

FYI,

Greg

Sounds to me like a PC board ground (board mounting hardware) problem, screws may be loose. The edge where the board mounts to the chassis studs provide a ground and it's possible one or more of the grounds are not making good contact.

I also would no rule out one or more of the board's plugs. The plugs have been known to create a number of problems due to age, use, and environmental affects.

Found the trouble with the RL1 relay on the AF board...the TS830S has the Vox on/off switch on the Vox gain, whereas the TS530S has a seperate switch top left side...the TS830S VOX was in the 'ON' position. The relay dosen't operate when the VOX is turned 'OFF'.
I notice that the TS530S's RL1 relay intermittantly operates when changing modes, but not everytime like the TS830S. I suspect it is im the Vox delay setting.

The other problem was the PCB's grounding....All fixed now.

Thankyou for your advice

Hi Marc,

That does help. It is good to know that AM transmit does work.

The standard TS-830S operator's manual does not cover the AM UNIT nor does it show the AM UNIT's connections to the IF UNIT and AF UNIT.

I recommend downloading the TS-830M operator's manual if you do not have it. It's available at the following link.

http://www.radioamateur.eu/schemi/TS830M_user.pdf

The TS-830 service manual, page 61, also shows the AM UNIT and how it is connected.

Hello Allen,

Congratulations on fixing your 830.

Unfortunately, the VOX circuit being turned ON actually had nothing to do with the receive and full scale meter problem you experienced. The problem was more than likely caused by poor/loose PC board grounds through the mounting hardware which you have confirmed in your response.

When changing modes with the VOX turned ON, noise is produced that is fed to the VOX amplifier and ultimately to the VOX RELAY amplifiers on the AF UNIT resulting in the relays energizing. The length of time the relays remain energized is determined by the VOX DELAY setting. This is normal and is not a sign of failure. Receive should return immediately when the VOX DELAY times out, relay amplifier's capacitor discharges resulting in the relay amplifier no longer conducting.

Anyway, again, congratulations on fixing your 830.

Thanks, that's a mix coil unit, and I need a drive coil unit, but maybe that seller will have what I need. I'll keep watch.

22511. TS 830S Coax problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-23 00:46:05 UTC
From: gyancey52
Topic: 22511 Message: 22511

I got this unit about a week ago and when I first fired it up it worked great and then started loosing signals. I thought it wasn't getting any signal so I pulled the send/receive relay and cleaned the contacts but still wasn't getting any signals. I was messing with the coax and found that if I unscrewed it and left it setting in the connector I got good signals but the S meter doesn't deflect but I think that is just an adjustment. I put two different coax cables on the radio and both do the same thing, seems to be a ground issue on the connector but I wanted to check to see if anybody elese had had this problem.

22512. Re: [TS-520_820_530_830] TS 830S Coax problem

You have a short somewhere in your antenna system that is causing these problems for you. When you disconnect the shield, your entire coax line is acting like an antenna. If the short were in the connector in the radio, the situation would sound the same whether the shield was connected or not.

Please recheck all the connections to your antenna system, and I am sure you will find a short somewhere, probably at the other end of the cable!

Good luck, and 73, Jim AG3Y

Hello Mike,

I checked the voltages you suggested and all voltages are correct. I cleaned both plugs on the AM board
and connected and disconnected them several times. I also cleaned the plug on the IF board which connects to
plug 1 on the AM board. I cleaned the contacts on Relay 1 on the AM board with Deoxit. Still not hearing
any signals on AM, but as usual the S meter is responding to incoming signals when switched to AM mode.
Unfortunately Mike I do not have a scope to trace the signal.

Marc.

Hello Marc,

The AM UNIT is powered by 12VDC supplied from the AF UNIT's "12" terminal. Ensure 12VDC is present on the AM UNIT by measuring the voltage between plug 2 pin 3 and chassis ground. If there is no 12VDC on plug 2 pin 3 the AM UNIT will not function. Also check for 9VDC at the AM UNIT's AMS terminal. This voltage is only present with the MODE switch in AM.

I also recommend removing both AM UNIT plugs, give a shot of contact cleaner to both AM UNIT sets of pins then reconnect both plugs a few times.

Trace the signal from the IF UNIT to and through the AM UNIT then back to the IF UNIT.

If possible, clean the relay contacts of RL1 on the AM UNIT. A corroded connection can affect the signal as it flows through the AM UNIT, especially the output of Q2 that flows through RL1-2 to the AF UNIT.

Check the AM UNIT's mounting hardware to ensure they are tight.

Hi Marc,

That does help. It is good to know that AM transmit does work.

The standard TS-830S operator's manual does not cover the AM UNIT nor does it show the AM UNIT's connections to the IF UNIT and AF UNIT.

I recommend downloading the TS-830M operator's manual if you do not have it. It's available at the following link.

http://www.radioama teur.eu/schemi/ TS830M_user. pdf

The TS-830 service manual, page 61, also shows the AM UNIT and how it is connected.

Hello Marc,

The S meter will always indicate a receive signal in AM regardless whether the AM UNIT is working or not. The AM UNIT has nothing to do with the S meter indication in AM.

The 830's AM UNIT is the receiver's AM detector and only functions when the mode switch is in AM.

My initial suspicion is D1 (1N60 germanium diode) on the AM UNIT is open.

Q3 has nothing to do with the symptoms you are experiencing. Q3 is a relay control switching transistor for RL1 on the AM UNIT, nothing more. From your statements the relay on the AM UNIT is working when the MODE switch is placed in AM.

Have you tried listening for the 830's Marker (calibrator) signal and adjusting the DRIVE control for a peak S meter reading? This would be my first suggestions. Completely remove the coax cable at the rear of the 830 then turn the Marker ON and tune for the Marker signal.

Hi it was sometime last year i had a problem with my ts830 ip reading over the 225ma when tuned.Its was indeed the four cathode bias resistors,thanks to w5rkl,ke5put,n6wk and every one else who gave input on the matter.Well now ive got a really nice 830s 100 watts on every band even 10 metres.really pleased.
My next question for the group is about a ts520se,only owned it for a week or so and found the s-metre sensitivity not so good.Ive read the manaul and looks like i need a signal generator its a couple of s points down and only a s7 with the cal-25.Also its had a 6,6 mosfet fitted in q3 rf amp,could any body tell me about this mod.

Regards Shaun

Thanks for all the help, I found the problem with the coax, insulator was in the wrong position. Just to give a little background. I am presently using a 102" whip for reception only until I can get my Titan DX installed which will be a couple of more weeks as I am recovering from surgery having a kidney removed. I just got my call sign yesterday and am excited to start using it. My S meter is not deflecting any signals no mater how strong they are, do I need to open another topic or can we just go from here?

Hello Shaun,

Glad to hear your 830 is working great. Always good to hear these responses.

I must say I am not aware of a modification for the receiver's RF amplifier in the 520SE. It may be a subsitute for the Japanese transistor. Some of the original transistors used by Kenwood are very difficult to find if one can find them at all. Substitutions are common which may not be the same transistor as the original.

You can use the Marker to set the S meter. I use 80 meters and connect a dummy load to the antenna SO-239 on the rear of the transceiver. The dummy load provides a 50 ohm load to the transceiver.

Set the 520SE on 80 meters, tune to 3.700, and then adjust the S meter zero pot for a zero no-signal meter indication. Once that is accomplished, turn the Marker ON and tune the VFO for maximum S meter indication. Adjust the DRIVE control, again for maximum S meter indication. If the S meter is below S9, adjust the S meter gain pot for an S9 reading.

I have used this method for quite some time now and it works well for me. I compare the adjustments with my Yaesu FT-757 (receive preamp turned OFF on the 757) and it's quite close.

Check the AGC switch on the front panel. If it's set to "OFF", the S meter will not indicate an S meter reading on any signal regardless of how weak or strong the signal is.

22523. Question 599D Twins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-24 02:36:56 UTC
From: medical35
Topic: 22523 Message: 22523

When I put the 599D twins in transceive mode and use the transmitter VFO as the RCVR the freq. is on the money.
When I switch to the receiver as the transceive VFO it is off by 15.5 KCS.
I'm using my Omni VII to check this.
I just had a guy align them. Am I doing something wrong? Or did he do something wrong? hi hi.
WWV is on the money.
My 25khz calibrator seems whacky also.
At the bottom of any band I can't hear it on for example 7000 or 7025 but I hear it at 7050 and every 25 kc there after.
Anybody got any ideas what's wrong?
Thanks.

Hi Marc,

I agree, having the spare parts in the event other components are found to be bad is a good thing.

If you can borrow an oscilloscope, you can trace the AM signal through the AM UNIT quite easily, starting at the IFO2 terminal on the IF UNIT. You do not need an actual AM incoming signal to do this. The 830's Marker (calibrator) signal can provide the "carrier" signal, just as an incoming AM signal would have, to trace the signal through the AM UNIT.

At this point, with the information you have provided, I do not believe any of the other stages, RF, IF, PLL, and AF units are contributing to your problem. If they were then SSB and CW modes would be affected, which they are not.

Hearing your 25Khz marker EVERY 25Khz is how it is SUPPOSED to work ! You will get 4 marks for every 100 Khz, just like you get 1 mark for every 100Khz with the 100 marker! Perfectly normal.

When you switch sidebands, you have to re-center your VFOs. Are you using the same sideband or mode with both the transmitter and the receiver? Does the background noise change in frequency characteristics when you switch between USB and LSB ?

I just got my twins and am having some problems with the offset crystal. Looks like I will have to get a USB crystal for my receiver. That is what mine is doing, and I have determined that my USB crystal is about 600 hz off frequency at the closest setting of the trimmer (goes higher yet if I turn the trimmer !)

I haven't even set up the transmitter, yet! But I will be as anxious to see any other responses about the frequency accuracy of these units as you are.

Wish us both good luck and good answers!

Subject: [TS-520_820_530_830] Question 599D Twins

When I put the 599D twins in transceive mode and use the transmitter VFO as the RCVR the freq. is on the money.
When I switch to the receiver as the transceive VFO it is off by 15.5 KCS.
I'm using my Omni VII to check this.
I just had a guy align them. Am I doing something wrong? Or did he do something wrong? hi hi.
WWV is on the money.
My 25khz calibrator seems whacky also.
At the bottom of any band I can't hear it on for example 7000 or 7025 but I hear it at 7050 and every 25 kc there after.
Anybody got any ideas what's wrong?
Thanks.

Jim,
If the trimmer is a ceramic one try a little deoxit, turn it back and forth a few times and see if it clears up. May be just some oxidation changing the capacitance of the trimmer.

If you have access to a frequency counter, pull the R-599's VFO cable from the rear of the VFO. Connect the frequency counter to the VFO's rear RCA socket. Set the dial to .050 and turn the R-599 ON. What frequency is displayed on the frequency counter? It should be very close to 5.450Mhz.

I also recommend checking the AVR UNIT "9V OUT" terminal, it should measure 9VDC. If it does not, adjust VR1 on the AVR UNIT until it does.

At this point the Marker is not an issue. The Marker can be dealt with and adjusted later.

I'm certainly going to try some other things before I pay 30 dollars or more for a crystal. I would hate to see a new crystal behaving EXACTLY like the old one !

I was also told to check for "other things" in the circuit. There are three 10K resistors and transistors in the circuit that switch in and out the various crystals. If one of those resistors has changed value, or the transistors are not fully switching on, that might change the frequency the crystal is oscillating at, too, I suspect.

Well, I must check that out, and then see if there is any difference. I don't know about the trimmers. The crystal drops out of oscillation if I move the trimmer too much, and that is a repeatable condition. More investigation needs to be done before purchasing a part !

Thanks for your advice, and I will keep the group posted .

We were all new at this once. At least you are smart enough to ask, rather than damage your radio. My experience is that you probably are not going to have to tune if you stay in the same band, although a little care to touch up when moving around or between sessions is not a a bad thing. With that being said, when my son was little, I used to be very careful to tune every time, because he loved to play with the knobs when I wasn't looking. Enjoy that rig. I bought a used one on a tip from a friend several years ago, and it has become my favorite rig. the price was right and it provides me with countless hours of enjoyment.

I am having problems with my 830s S meter not deflecting. The meter will show some signs of life when running through the frequencies but drops to the far left during monitoring no matter how strong/loud the signal seems to be. I tried to look in the history and found information indicating to look in the service manual on page 47 for instructions on adjustment. However, page 47 on the version I have shows the VFO. Also it said if a signal generator is not available there is a built in calibrator. How do I go about using this. I need instructions on how to adjust my S meter.

You said:

"When I put the 599D twins in transceive mode and use the transmitter VFO as the RCVR the freq. is on the money. When I switch to the receiver as the transceive VFO it is off by 15.5 KCS."

I take that to mean that when you use the R599's VFO to control both receive and transmit (transceive), "ALL" bands are off frequency by the same 15.5Khz.

If that is correct, the RF UNIT heterodyne oscillator crystals are NOT the source of the problem.

In order for the RF UNIT's individual bandswitch selected heterodyne oscillator crystals to be the source of the frequency error, each individual crystal would have to be off frequency by the exact same amount AND be off frequency in the same direction. That is highly unlikely to have occurred.

Hi Mike,

Cannot think at the moment where I could get my hands on an oscilloscope, but I can see from your instructions it would be a very handy piece of equipment to have. I have looked at them on the internet and am thinking seriously of buying one. From what you say, it does not
look as though other parts of the circuit are affected, which is a good thing. I just have the
feeling that D1 could be the culprit. We will see when my order arrives.

Marc.

Hello Mike,
I checked the 9V on the AVR unit and it is 9V. I don't have a freq. counter though.
Thanks,
Jim

Oh, that is strange, indeed ! I DID misread your post, and see that you said caN'T hear it !

You might think I am getting senile , but I don't believe that to be the case.

1. We are both thinking of crystals, and frequencies being off, but of course the problems are somewhat unrelated in every other way.

2. It does sound to me that my radio has offset problems caused by the offset oscillator(s?) for USB, LSB, CW, and that your radio has a VFO frequency problem !

3. Your problem does NOT sound like an offset crystal problem , but is most likely related to one VFO, the other VFO, or even to both VFOs being off a small amount in different directions !

I would follow the suggesting about tuning the VFO frequency around 5 Mhz in on another receiver and see what you can determine that way.

Remember, you do have to use different sides of the dial when you are receiving either LSB or USB (perhaps CW too?) That is why there are those three marks on the dial scale , with two being on either side of the main center marker. But if you have offset problems along with VFO frequency problems (pretty unlikely as mentioned in an earlier post) you could be all around but not on the desired frequency. It will be interesting to see what we both find!

Good luck with your problem, and I hope you wish me good luck with mine !

73, Jim

I have just started to looking into my radio, and as I said, I am hopefully not going to spend some significant money on parts until I have determined that much less expensive parts are not the cause of the problems.

Hi Marc,

You do not have to spend a lot of money on test equipment. A simple VTVM, signal generator, frequency counter, and oscilloscope will provide you with everything you need to troubleshoot and eventually repair ham gear. I have 2 VTVMs, one from Eico and one from Allied, both do an excellent job. The scope I have is a 20Mhz dual trace that I purchased "NEW" for $100. The signal generator I use is an AN/URM-25D I purchased from Fair Radio Sales in Lima, Ohio, check them out at http://www.fairradio.com/

If you find a simple signal generator such as a Heathkit IG-102 for a cheap price, buy it. I have one that cost me $20 and is in excellent condition, works very well. It's not as stable as the URM-25D but it will provide you with an RF signal. I use it with the URM-25D when substituting oscillator signals.

That's good since the VFO and other circuits relay on the 9VDC as a power source.

The 9VDC is produced on the AVR UNIT from the 14VDC supply.

A failure in the 14VDC supply will result in a complete loss of both 14VDC and 9VDC. No 9VDC, no VFO signal and the other circuits that operate from the 9VDC supply will also not work resulting in a receiver that appears "dead". The relays, if the equipment has relays, will also not work since the relays operate from the 14VDC supply.

22540. RE: [TS-520_820_530_830] Re: Question 599D Twins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-24 22:57:19 UTC
From: Greg Anders
Topic: 22523 Message: 22540

If I read this issue correctly,

1. When the two units transceive using the transmitter's VFO, the receive and transmit frequencies are the same (as one would expect).

2. When the two units transceiver using the receiver's VFO the frequency is off by 15.KC. As compared by listening on the OmniVII.

This sounds to me like there is something wrong with the receiver VFO maybe....

The one question I would ask is "if you switch to separate them (non-transceive operation) and tune in a signal on the Omni VII, does the receiver receive that same signal reading out the same frequency as the Omni???? In other words, does the receiver track signals on the same frequency as the Omni when it is operated stand alone?

Greg

Hello,
I can't help but think I've got something hooked up wrong or am doing something wrong. Because when I put them in transceive and use the RCVR vfo as the main rig it is off by about 25kc.
When I do the opposite and use the transmitter vfo as the main rig the freq. is correct. I would just use it this way but the RIT doesn't work when I have it this way. It does the other way.
The reason I think I'm doing something wrong is the fact that it's off 25kc.
If it was anything else I would think it would be an odd number.
I am using CW only and going by the center mark on the dial per the manual.
I can use the rig and get great reports. I just have to look at the dial on 40 meters for example as 7000 being 7025 and 7050 being 7025 and so on.
I have the original transceive cables joining the rigs together and the original antenna interconnect cable.
The person who aligned it said he went by the service manual for the 599 S but that it is the same as the D model.
He used WWV to align as per the service manual for the 599 s and he also went by something to do with 14 mhz.
Is the S model the same as the D that I have as far as alignment?
It is a one owner with original manuals and even the warranty card. (to late to send it in now)
It has the original tubes but they are in great shape.
Looks like a new one. I don't think it's been abused is what I'm pointing out.
Thanks,
Jim

Hello Greg,
Yes. When I use set JUST the xmitter by itself wihout the rcvr hooked up in any way and set it to say 7025 I hear it on my Omni VII on 7025. No problem. All is well.
And it will do the same thing hooked up in transceive using the xmitter vfo in control.
BUT it is off about 25 kc when I go to tranceive and use the RCVR as the control.
So yes it's not tracking correctly. But it will track but it will be off about 25 kc.
I would just use the xmitter as the control rig but the RIT will not work in that configuration. I don't know if that is the way it is. I wouldn't think so.
I've used lots of separate rigs before such as the Drakes, etc. but never had a problem.
Thanks,
Jim

No 9VDC, no VFO signal and the other circuits that operate from the 9VDC supply will also not work resulting in a receiver that appears "dead". The relays, if the equipment has relays, will also not work since the relays operate from the 14VDC supply.

Hi Jim,

This is a very strange issue. I too have used, refurbished and aligned numerous separate units for transceiver (S-line, Drake-4 lines, Swan Twins). I owned a set of the Kenwood twins and never had an issue (small consolation to you)....

Anyway, I think your receiver is aligned OK. Most "separate" setups share either "just" the VFO in shared-transceive or they share the BFO from the control unit.
Does the manual indicate what is actually being shared? The only thing I can think of is that it is possible that the transmitter is "loading" the VFO in the receiver when you use the receiver VFO to drive both units. I know you checked the +9V supply voltage in the receiver, but I wonder if that dips when trying to use the receiver VFO to set freq. on both units???? In other words check the +(VDC when you select transceiver using the receiver VFO. I had a Yaesu hybrid that did this and my VFO jumped 18 kc.

FWIW, its something to check. This is soooooo rare it has to be fixable....

Greg

I would remove the transceive cable and check the alignment of both units as two non-connected pieces of equipment. The transmitter stand-alone requires nothing other then a dummy load and sounds like it's functioning the way it should. The receiver will require several jumpers in the connector where you plugged in the tranceiver cable. Out of the box, the R-599D came with this jumper plug. Note: the VFO signals between both units are tranferred through the transceiver cable. If you can determine how each performs stand-alone, and if there are issues, solved them, then you can set up for transceiver operation and then decide if you have further issues. Hopefully, you have a good frequency counter, a scope, and a decent signal generator to aid in servicing, because without them, finding the problem is like trying to catch flies in the dark.

Check the offset voltage right at the Rx VFO terminal in both separate and transceive mode - a LARGE change could lead to a connection problem in the transceive cable or connectors or wiring around them, maybe the relay in R599 - check the rx diagram.

If you push the dial of the receiver back towards the chassis it will allow you to turn the dial without changing the frequency of the VFO. This way you can match what the VFO is set to and what the dial reads.

Subject: [TS-520_820_530_830] Re: Question 599D Twins

Hello,
I can't help but think I've got something hooked up wrong or am doing something wrong. Because when I put them in transceive and use the RCVR vfo as the main rig it is off by about 25kc.
When I do the opposite and use the transmitter vfo as the main rig the freq. is correct.
I would just use it this way but the RIT doesn't work when I have it this way. It does the other way.
The reason I think I'm doing something wrong is the fact that it's off 25kc.
If it was anything else I would think it would be an odd number.
I am using CW only and going by the center mark on the dial per the manual.
I can use the rig and get great reports. I just have to look at the dial on 40 meters for example as 7000 being 7025 and 7050 being 7025 and so on.
I have the original transceive cables joining the rigs together and the original antenna interconnect cable.
The person who aligned it said he went by the service manual for the 599 S but that it is the same as the D model.
He used WWV to align as per the service manual for the 599 s and he also went by something to do with 14 mhz.
Is the S model the same as the D that I have as far as alignment?
It is a one owner with original manuals and even the warranty card. (to late to send it in now)
It has the original tubes but they are in great shape.
Looks like a new one. I don't think it's been abused is what I'm pointing out.
Thanks,
Jim

That brings up an intersting question that I have about the VFO dial. I love that silky smooth feel that the dial has, but it is almost too loose! Is there any friction set for the dial, like there is on my old Icom gear ? I don't see any reference to one so far. Just wonder if some of you more experienced fellows might know about this.

I really appreciate all the info we are getting about these 599s! All of it is being stored with the manuals that I have for the units. BTW, if anyone would like a portion of a schematic blown up for reference (originals are rather small) I might be able to do it, and put the results into the files section ! Just offering !

If you push the dial of the receiver back towards the chassis it will allow you to turn the dial without changing the frequency of the VFO. This way you can match what the VFO is set to and what the dial reads.

Subject: [TS-520_820_530_830] Re: Question 599D Twins

Hello,
I can't help but think I've got something hooked up wrong or am doing something wrong. Because when I put them in transceive and use the RCVR vfo as the main rig it is off by about 25kc.
When I do the opposite and use the transmitter vfo as the main rig the freq. is correct. I would just use it this way but the RIT doesn't work when I have it this way. It does the other way.
The reason I think I'm doing something wrong is the fact that it's off 25kc.
If it was anything else I would think it would be an odd number.
I am using CW only and going by the center mark on the dial per the manual.
I can use the rig and get great reports. I just have to look at the dial on 40 meters for example as 7000 being 7025 and 7050 being 7025 and so on.
I have the original transceive cables joining the rigs together and the original antenna interconnect cable.
The person who aligned it said he went by the service manual for the 599 S but that it is the same as the D model.
He used WWV to align as per the service manual for the 599 s and he also went by something to do with 14 mhz.

Is the S model the same as the D that I have as far as alignment?
It is a one owner with original manuals and even the warranty card. (to late to send it in now)
It has the original tubes but they are in great shape.
Looks like a new one. I don't think it's been abused is what I'm pointing out.
Thanks,
Jim

Here is a tip for anyone who wants a little friction in VFO dial drives.

I own a Yaesu FT-1000D which is notorious for having a knob that will fly from one end of the band to the other with just a spin. Very annoying when you are trying to zero on a net.

Anyway, here is a simple solution that may work on other radios.

Felt car battery washers. You know, the ones they sell for the terminals.....

Yes, go to the local auto store and buy a couple of those thin felt washers. You can put one behind the knob and if it fits you will have just a small amount of friction if you adjust the position of the knob on the shaft correctly.

This simple modification now makes my FT-1000D very very easy to tune precisely. I used a slight application of glue to hold the washer to the knob on the backside.....

FYI,

Greg
KG6YV

Could be the tuning capacitor plates shorting out at the bottom end of the tuning range. This would show up on every band. A close inspection of the plates is in order or a monitoring of the vfo output to make sure that there is a proper output signal at all positions of the tuning cap.

I have the replacement relay from K4EAA but is the relay on the rig a "solder in" or is it in a socket?

Hi Sid,
if it is the T/R relay, it is plugged into a socket under the Finals
Area inside a small metal enclosure.

Hello Kurt,
I have felt all along that this may be the problem. But I can't get it to do it.
I am pushing in as hard as I can on the front of the tuning dial but nothing is happening.
Can you elaborate on anything that might help me do this? Or give a detailed description?
I know it's pretty cut and dried like just push in the the front and the dial and turn it but I'm doing that and nothing is happening.
Thanks,
Jim

The outer dial with the calibration marks on it, should be about a 16th of an inch away from the front panel. The knob should turn freely, (almost too freely) and you should be able to lightly push on the outer dial and turn it at the same time. If you can't the large knob with the indented areas between the ridges is mounted too far back on the tuning shaft.

It also helps if you do the operation with both hands. Hold onto the serrated knob and turn the larger dial plate with your other hand.

Check the mounting of that knob assembly on the shaft and see if the dimentions are right. Too far back and you probably won't be able to free the skirt. Too far forward, and the skirt with rub against the dial window!

Good luck, Jim AG3Y

Subject: [TS-520_820_530_830] Re: Question 599D Twins

Hello Kurt,
I have felt all along that this may be the problem. But I can't get it to do it.
I am pushing in as hard as I can on the front of the tuning dial but nothing is happening.
Can you elaborate on anything that might help me do this? Or give a detailed description?
I know it's pretty cut and dried like just push in the the front and the dial and turn it but I'm doing that and nothing is happening.
Thanks,
Jim

Hello Jim,
I guess I misunderstood Kurt. I thought he was talking about being able to turn the part of the dial inside the radio that lights up.
I know how to turn the dial behind the main tuning knob that you're talking about.
My dial or the alignment is way off because I can hear cw signals way below 7000 kc on 40 or 3500 on 80.
But it's on right on the money when I put it in WWV. What the heck?
I would have to send it to someone who knows what they're doing but that would cost a lot I imagine.
I just paid one guy to align it. I guess he didn't know what he was doing.
Thanks,
Jim

22559. Re: Question 599D Twins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-26 13:24:38 UTC
From: w5rkl
Topic: 22523 Message: 22559

Jim,

Your initial post stated:

"When I put the 599D twins in transceive mode and use the transmitter VFO as the RCVR the freq. is on the money. When I switch to the receiver as the transceive VFO it is off by 15.5 KCS. I'm using my Omni VII to check this."

Yet, now you saying:

"....When I use set JUST the xmitter by itself wihout the rcvr hooked up in any way and set it to say 7025 I hear it on my Omni VII on 7025. No problem. All is well. And it will do the same thing hooked up in transceive using the xmitter vfo in control. BUT it is off about 25 kc when I go to tranceive and use the RCVR as the control. So yes it's not tracking correctly. But it will track but it will be off about 25 kc."

Which frequency tracking error is correct, "15.5Khz" or "25Khz"?

Since you do not have a frequency counter you can use the Omni VII to "listen" for the R-599 VFO signal.

Performing the following simple test will NOT, in any way, damage the R-599! Just be careful when removing the R-599 VFO signal cable so you do not break the cable loose from the RCA plug. Do NOT remove any other cables plugged into the rear of the R-599 VFO. Remove ONLY the small coax cable with the RCA plug attached that is plugged into the rear of the R-599 VFO!

Unplug the R-599 VFO's signal cable, the one with the RCA plug on the end.

Using a simple stereo interconnecting cable (RCA plug on both end), plug one end of the stereo cable into the R-599's VFO RCA socket. Lay the other end of the stereo cable next to the Omni VII's antenna connector (SO-239).

Tune the R-599 dial to 00. It does NOT matter what band switch setting or MODE switch setting the R-599 is set to.

Set the R-599 dial to the bottom of the dial, "00". The "00" should be centered over the "middle" dial marker, not the left or right dial marker. Do NOT change this setting!

Turn the R-599 ON.

Remove the antenna coax feed line from the Omni VII and set the Omni VII to any mode. Do NOTt key the Omni VII at any time!

Turn the Omni VII ON.

Tune the Omni VII to "5.500Mhz".

Do you hear a beat note in the Omni VII? If not, tune the Omni VII dial up or down from 5.500Mhz until you hear the R-599's VFO signal.

Once you hear the R-599's VFO signal, tune the Omni VII dial for a "zero beat" and note the frequency displayed on the Omni VII's digital display. This will give you the "approximate frequency error", if any, of the R-599 VFO.

Once you have noted the frequency error, remove the stereo cable from the rear of the R-599 VFO and plug the small coax cable back into the R-599 VFO.

Let us know what the frequency error, if any, actually is.

Hello Mike,
There is no plug of any type on the back of my VFO.
There are four posts with wires soldered to them on the right side of the VFO. That's all.
But none of them "unplug". They would need to be unsoldered and would be hard to get to.
I won't go into the 15.5kc versus 25kc thing again as it is to confusing to the group as I'm not able to explain it well.
Suffice it to say the RCVR is way off freq.
I also can hear cw signals below 7000 on the dial. As far down as the dial goes past 7000 which is a good ways.
I would send it to someone to be fixed but don't know anyone who would do it without having way to much in it.
With shipping and all I've already got way to much in it.
I've sent several emails and left several voice messages to K4EAA over the past year about a TS 520 I want fixed but he doesn't answer either.
I don't know of anyone else who "specializes" in these rigs.
If someone does please let me know.
73,
Jim

You could just attach a piece of wire to the proper post and the other receiver would probably pick up the signal just fine.

I did that when I was searching for the offset crystal frequencies, and got plenty of signal to be picked up on a separate receiver !

Where do you live? Man I wish we could get together, but I bet you are no where close to Hagerstown, MD !

Good luck, and let us know if you are able to hear that VFO . I bet the knob is mounted incorrectly on the shaft for some strange reason.

73, and good luck, Jim

Afternoon Jim,

I guess Kenwood had the VFO connections; power, RIT, VFO signal cable. and ground, all hardwired. The manual does not show a good picture of the VFO connections. Having worked on Kenwood hybrids, I have assumed the R599 VFO had a plug in VFO signal cable. That's what I get for assuming...:)

Unfortunately I do not know of anyone else that works on Kenwood other than the ones you have already mentioned.

If you could, look closely at the dial assembly, paying close attention to how the dial itself is attached to the tuning shaft.

How far can you tune the VFO Counter Clockwise? Can you tune the VFO until you reach the mechanical stops? Don't force the dial beyond the stops!

Hello Mike,
Turning the VFO clockwise it will go well beyond the last number on the dial which on the RCVR that number is 600.
The dial will go about an inch beyond the last number on the dial which is 600.
Going CCW it will go beyond the first number on the dial which is 0 of course.
It goes about 3/16ths past zero.
If the VFO zero's with WWV when I put it in the WWV position on the bandswitch, which it does, wouldn't that be a sign that the alignment is fine and the lighted numbers on the dial are off?
So couldn't I just somehow move the dial inside the rig, not the one behind the main tuning knob, and get it on freq?
So far I've not been able to figure out how to move that dial or even if I should.
The guy who aligned it said he did it per the manual and the service manual for the 599S because Kenwood didn't make a service manual for the D model as they said they are the same.
At least that's what several sources on the internet say.

Hello Charlie,
I live a little south of Nashville, Tn.
I agree with you Charlie. There are signs that this rig has been very well taken care of. Even still has the warranty card and original manuals and looks great. One owner.
I don't think there is anything major wrong with it. I use it now on CW only as that's all I do.
But I just have to look at the dial on the RCVR as being about 25kcs off. hi hi.
All reports are no chirp, great cw tone and no drifting.
I know there is no one in my area that I would trust to work on this.
I'm already out a lot of money from a guy here who supposedly knew what he was doing.

Hi Jim,
So if I understand correctly, if you look on page 11 of this manual,
http://www.n6wk.com/kenwood/Kenwood%20R-599D%20Operator%20Manual-2.pdf
It is Item number 15 that is off by 25kc?? Inside the little window.. Correct?
Please verify this for me.
Also, I am surprised Ken K4EAA didn't get back to you. Ken and I share Emails quite often.
He is a very busy man though as I have also become.

Thanks,
Gordon

Hello Gordon,
Yes that is the one. Page 11 and item 15. It is not off by 25kc exactly but between 15.5kc to 25kc.
Thanks,
Jim

Jim,
Does that offset seem to be uniform across the complete spectrum of
the VFO?
If so, I'm thinking that the Dial has actually slipped on the main
shaft. If you remove the Knob, can you gain access to the main dial Plate?
I haven't worked on any Twins in many many years, so I have forgotten
the setup of the Dials

For reference sake, my VFO dial goes almost 45Khz lower than the zero mark at the lowest frequency, and goes 15Khz above the highest mark at the highest frequency. I am referring, of course, from mechanical stop to mechanical stop here.

The tracking isn't perfect, but I can receive the entire band in any case, and if I use the 25Khz marker, it is certainly within 100 hz or so from marker to marker.

The other Jim, AG3Y

Hello Gordon,
Right now I don't have a screw driver that will fit down in the main dial hole.
I could pick one up tomorrow.
What about coming at it from the other side by taking the cabinet off?
Or should I even do this? Do think this is the problem?
73,
Jim

22573. Re: Extra filter

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-27 12:08:17 UTC
From: wrench101
Topic: 22448 Message: 22573

I have found a bad trace on the board and the 820 now sounds beautiful like it should. The way the extra filter was wired made it sound as if ssb was only 250hz wide. Now ssb and cw sound perfect. Now I need to take the display apart and repair it. I've heard that it is famous for poor contact at connectors and having poor solder joints. Anywho, thank you all for your help. Greatly appreciated! 73 de AI4NV

Hi Mike
Thanks for the reply,tried to adjust vr1 vr2 no change when turning them,did every thing as you told me to,its no big issue because the radios working fine otherwise,any idea mike.

Hello Shaun,

Glad to hear your 830 is working great. Always good to hear these responses.

I must say I am not aware of a modification for the receiver's RF amplifier in the 520SE. It may be a subsitute for the Japanese transistor. Some of the original transistors used by Kenwood are very difficult to find if one can find them at all. Substitutions are common which may not be the same transistor as the original.

You can use the Marker to set the S meter. I use 80 meters and connect a dummy load to the antenna SO-239 on the rear of the transceiver. The dummy load provides a 50 ohm load to the transceiver.

Set the 520SE on 80 meters, tune to 3.700, and then adjust the S meter zero pot for a zero no-signal meter indication. Once that is accomplished, turn the Marker ON and tune the VFO for maximum S meter indication. Adjust the DRIVE control, again for maximum S meter indication. If the S meter is below S9, adjust the S meter gain pot for an S9 reading.

I have used this method for quite some time now and it works well for me. I compare the adjustments with my Yaesu FT-757 (receive preamp turned OFF on the 757) and it's quite close.

I have scanned many ofthe past postings on this subject and was hoping that some of the more experienced guys could share someadvice. I have two basic types of D104 mics. One type has a UG-8 base and the other has a TUG-8 base. The TUG8 has the preamp and te UG-8 does not. Which of these two microhones would be the best choice assuming they are wired correctly? Is there a benefit with these over the MC-50? I have two of those as well and one works much better than the other. Thanks for any help or suggestions. 73 Peter.

I have been on HF for over 33 yrs. I have owned several models of Kenwood radios starting with the 520, 820, 830. I have tried both the amplified and non amplified D-104 on most of them. Nothing beats the MC-50 for audio quality and with the speech processor delivers the 'punch' with good clean audio......that's my story and I'm stickin' to it.

Hi Peter. I have ti agree with Gene on this one. Its hard to beat
the sound of the MC-50, and the D-104 mics don't come close. If one
of your MC-50 mics sounds better than the other, try reversing the
plug on the mic. The MC-50 has two impedance settings, and they are
switched by which the plug is plugged in. If that is not the problem,
you could have a bad connection somewhere, a bad mic cord, or the mic
element may be damaged (though that is kinda rare).

I would check the alignment in the 520SE service manual.

If you do not have the 520SE service manual, you can download it at the following website:

http://www.n6wk.com/kenwood/

You might only need a slight adjustments. If you do not have a signal generator you can use the Marker.

Peter,

Here's my 2 cents. As the others have stated, stick with the MC-50. It's designed to operate with the Kenwood hybrids so best to stick with it.

> I have scanned many ofthe past postings on this subject and was hoping that some of the more experienced guys could share someadvice. I have two basic types of D104 mics. One type has a UG-8 base and the other has a TUG-8 base. The TUG8 has the preamp and te UG-8 does not. Which of these two microhones would be the best choice assuming they are wired correctly? Is there a benefit with these over the MC-50? I have two of those as well and one works much better than the other. Thanks for any help or suggestions. 73 Peter.

Hi Mike,
As I told you I have ordered the 1N60 diode to replace D1 on the TS830M AM board which is on its way
but not arrived yet. Today I decided to check D1. I lifted one leg of D1 off the pc board and it tested ok, High
resistance one way and Low resistance the other way. I decided to test L1 with the meter and it was open circuit,
should I not have got a short or resistance reading of some value ?.

Marc.

Subject: [TS-520_820_530_830] Re: TS830M

Hello Marc,

The S meter will always indicate a receive signal in AM regardless whether the AM UNIT is working or not. The AM UNIT has nothing to do with the S meter indication in AM.

The 830's AM UNIT is the receiver's AM detector and only functions when the mode switch is in AM.

My initial suspicion is D1 (1N60 germanium diode) on the AM UNIT is open.

Q3 has nothing to do with the symptoms you are experiencing. Q3 is a relay control switching transistor for RL1 on the AM UNIT, nothing more. From your statements the relay on the AM UNIT is working when the MODE switch is placed in AM.

Cathode resistors are a favourite for this. The original ones are
carbon composition, and will probably be found split open with bits all
over the bottom of the PA cage. Metal film resistors are perfectly okay
here, but don't be tempted to "uprate" the power. Better that a cheap
resistor fails than an expensive valve or hard-to-find PA choke or power
transformer...

Thanks guys, that is what I will do. I can save the D104's for my Drake. I have the mic cords with the dots lined up and the connector at the microphone on the H side. I have both set the same and on one I set the mic gain a little more than 1/2 and the other (seemingly not so good one) at full + rotation of mic gain setting. I tried to test the continuity in the cables and they seemed good. I checked the switch and everything looked ok. I stared at it quite a bit but it was no better :-). Thanks for all your help. 73's Peter.

Yes, sounds as though all 4 cathode resistors, R2 thru R5, 20 ohm 1/2 watt "each" resistor, have blown.

I would NOT operate the 830 until you replace the 4 cathode resistors, R2 thru R5.

Replace "ALL" 4 of the 20 ohm 1/2 watt resistors AND, as already stated, do NOT increase the wattage of the resistors. Install 4 new metal film 20 ohm 1/2 watt resistors for R2 thru R5.

Yes, if L1 was good, not opened, you should measure a short across it.

An open L1 will prevent voltage from being applied to Q1 which will result in the AM UNIT not working.

You can verify that L1 is the source of the problem in the AM UNIT by simply placing a temporary jumper across L1 to see if the AM UNIT starts working. If it works then you've found the problem.

Im starting to find a few issues with my 520.The bias increases after the radio is turned up only in lsb,there seems to be interaction between the drive and ip reading.
Also have i got this right vr2 for maximum reading,adjust from the bottom of the radio no need to remove the case,its just that the rit needs alignment is this the same pot?
I appreciate that the radio my need full alignment,any comments
i would be gratefull
Regards Shaun

Yes Mike, L1 is open circuit. I shorted the two legs of L1 and I got a "hiss" in the speaker
where I was getting nothing at all. I removed L1 from the board and double checked, it is open. Do you think this part will be difficult to get.

Marc.

Marc,

I'm not sure about availability. If the part value "1mh" is correct, Mouser sells one under the following part number:

542-5900-102-RC

It's a 800ma 1mh RF choke.

Price: $2.09

www.mouser.com

Enter the part number at the top of the page. Mouser says they have 149 in stock.

Depending on how the choke is wound, you might be able to rewind the original one. Of course if you can buy a new one, 1mh, for $2. then it's not worth rewinding the original.

Hope that helps.

Of course, one might wonder why it opened in the first place.

22595. TS 520 Pilot lights

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-28 22:42:50 UTC
From: Hartlessone
Topic: 22595 Message: 22595

I bought pilot lights from a supplier that were supposed to be replacements for the ones in my TS520. For any of you who have changed the lamps, you know how difficult it is. Anyway, they were NOT replacements. they did not produce any illumination on the dial. My question is, does anyone know where I can obtain the correct lamps and the grommets that are used? Thanks so much for your help.

Bill,

Try www.k4eaa.com and click on hard to find parts.

Hi Mike,
Managed to get a 1mH choke in our local Maplin Store and now have it installed.
The radio is now working in AM mode and I have had it running now in AM mode
for at least 3 hours.
Thank you Mike for all the help you have given me.

Also I would like to thank Pete WA2CWA and Daniel ON5PY for their input to the problem as
well.

Marc.

22603. TS-520 No transmit after a faulty vfo connector.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-29 03:24:03 UTC
From: radio165
Topic: 22603 Message: 22603

Hello folks,
I have had this TS-520 since 1984. It's been a good ole rig with very few problems. Now I have a problem. The rig was on as I was pulling it towards me on the bench to plug in or unplug something. I heard a snap come from the rear of the rig and the lamps flickered. I found that the shield in the VFO connector coming from the external VFO had broken free from it's pin and must have shorted on one of the others. This was repaired easily enough. But now I have RX but no TX. The VFO indicator on the dial goes out when the rig is keyed in any mode. This is also true when switched to the external VFO. I also tried with just the jumper between pins 8 and 9. The relay is energizing, the heaters are on and there is the 60mA idling current but no more.

This might be an easy one for someone who is more familiar with the circuit. Seems no matter what the question, there's always someone in the group that has some suggestions Hopefully someone can point me in the right direction.

Thanks
Mike Mackin

Hi Gang:

Can anyone tell me what the Variable resistor part number is that is exactly on the outside, right next to the CW filter on the IF board in a TS-520. I have found that mine just fell apart because the back piece that holds it together broke and the thing just fell into pieces. I do know that it is a 1K-ohm pot at least, and it is mounted on a raised board with a 3.3k-Ohm resistor on it and has a red and blue wires leaving each side of it.

I am searching the scematic and can't seem to find it and I am not shure what it does. I also have a problem with RL-2 relay chatter/clicking and am wondering if this might be part of my problem ???

Thanks

Just obtained a TS-520 in a sorry (external) state. Plate tuning cap is locked solid, load capacitor can only be turned with force. Fortunately internally no rust to be seen.

I am considering running this rig with a single 6146B in the PA and wonder if anyone has experience doing this and can relate his (her) experiences?

One of the many items I am considering is reducing the 800 Vdc to a bit lower.

Anyone having an opinion or suggestion on this matter, please chime in.

Thanks in advance, Marinus, ZL2ML.

Hi Marinus,
I'm not sure the single 6146B wil work correctly all alone, without changes in the pi circuit in its plate, and also in the driver plate circuit. Even with reducing the plate voltage, the change in impedance will be severe. I would try another approch, using insteed two 2E26 tubes (they have same pining as the 6146B) and divde by two the plate voltage (direct rectification insteed of voltage doubling), about 500 volts. The output will be around 55/60 watts very comfortable on the tubes and the power supply!
Other readers will give you other solutions too!

I heard a snap come from the rear of the rig and the lamps flickered. I found that the shield in the VFO connector coming from the external VFO had broken free from it's pin and must have shorted on one of the others. This was repaired easily enough. But now I have RX but no TX. The VFO indicator on the dial goes out when the rig is keyed in any mode. This is also true when switched to the external VFO. I also tried with just the jumper between pins 8 and 9. The relay is energizing, the heaters are on and there is the 60mA idling current but no more.

Running with only one 6146/2001 I think is mentioned in the manual for lower power license operators, originally a kit was available, it allowed the single heater to work .(normally the heaters are in series). I think that is the only requirement.

Hello Marinus,

I suspect the PLATE's "vernier" control is what's actually frozen, not the PLATE variable capacitor itself.

The stiffness in the LOAD capacitor appears to be caused by excessive dirt collection between the fixed and variable plates. Use canned air to remove the dirt then clean the bearings.

I do have one question. Is there evidence the 520 has been in a flood or having been stored in a barn, shed, or other "nature" controlled environment? I sure sounds like it has.

Is this to get 50W output? One mod I've seen is to rewire the mode switch so that the screen grid has the same voltage as for the TUNE setting. I'm not sure if this has any long-term horrible side-effects on the PA valves.

Another trick to reduce output power is to bias the ALC input a little with a PP3 battery and a variable resistor. This lets you have quite fine control over the output power down to a handful of milliwatts - useful enough that I'm surprised it didn't have that as standard!

The simple method of reducing TX power on SSB is to simply to reduce the mike gain or talk quieter, but this will give you a horrible noisy signal.

Hello Shaun,

Glad to hear your 830 is working great. Always good to hear these responses.

I must say I am not aware of a modification for the receiver's RF amplifier in the 520SE. It may be a subsitute for the Japanese transistor. Some of the original transistors used by Kenwood are very difficult to find if one can find them at all. Substitutions are common which may not be the same transistor as the original.

You can use the Marker to set the S meter. I use 80 meters and connect a dummy load to the antenna SO-239 on the rear of the transceiver. The dummy load provides a 50 ohm load to the transceiver.

Set the 520SE on 80 meters, tune to 3.700, and then adjust the S meter zero pot for a zero no-signal meter indication. Once that is accomplished, turn the Marker ON and tune the VFO for maximum S meter indication. Adjust the DRIVE control, again for maximum S meter indication. If the S meter is below S9, adjust the S meter gain pot for an S9 reading.

I have used this method for quite some time now and it works well for me. I compare the adjustments with my Yaesu FT-757 (receive preamp turned OFF on the 757) and it's quite close.

Hi Bill. Radio Shack has 12V bulbs that will work. They come in a package of 3 and are red, green, and yellow. To remove the color, you can use a bit of nail polish remover, or carefully scrape with a small sharp knife.

Hello Shaun,

If you adjusted VR2 on the RF UNIT board, you need to readjust VR2's setting so the voltage on T4's secondary center tap, in receive with the antenna disconnected, will be -3.5VDC.

Once the receive no-signal voltage is set to -3.5VDC and without changing VR2's setting, placing the 830 in transmit without RF output, the voltage at T4's secondary center tap should change to +1.3VDC.

You should also adjust VR1 so the voltage at the junction of one side of VR1 and C57 plus the junction of VR1's other side and C58 should be 2.5VDC in receive in both places. Adjusting VR1 should result in the voltage being the same at both places. Remember, the "2.5VDC" is in "receive" with no incoming signal applied to the antenna (remove the antenna). Without changing VR1's setting, placing the 830 in transmit, the voltages at both junctions should rise to +6.2VDC.

To see these voltages, download the high resolution schematic of the TS-830 at N6WK's website:

http://www.n6wk.com/kenwood/

Here's the link on N6WK's website for the high resolution schematic:

http://www.n6wk.com/kenwood/TS-830S-excellent%20schematic.pdf

> Hi Marinus,
> I'm not sure the single 6146B wil work correctly all alone, without changes in the pi circuit in its plate, and also in the driver plate circuit. Even with reducing the plate voltage, the change in impedance will be severe. I would try another approch, using insteed two 2E26 tubes (they have same pining as the 6146B) and divde by two the plate voltage (direct rectification insteed of voltage doubling), about 500 volts. The output will be around 55/60 watts very comfortable on the tubes and the power supply!
> Other readers will give you other solutions too!
> 73 GL
> F5UL, Bob

Bob, thanks for the 2E26 suggestion. I think the output will be lower than 55/60 watts, likely more around 40/45 watts. But I wonder about circuit changes required (neutralisation?), have you got any info on that? In any case it is an interesting suggestion that I'll research further since the PSK normally limit their input to the finals. With 100 % duty cycle the stress on the rig gets too much at ~ 100 watts out in PSK and blows up the transformer, besides other heat issues.

I see the 2E26 is in ample supply and cheap too, an added bonus, and it will avoid having to buy 6146B / S2001B since I suspect they need replacing too.

Don't know where it was stored but in the warmer climate here many hams that have a "shack" in a shed next to the house so storage is not normally in the best of conditions.

The other suggestions are appreciated too, keep them coming, many thanks.

Yes, the manual details exactly how to do this. I believe there is only a relatively minor change involved but cannot remember offhand what it was. I do not have access to the manual right now but do have it in PDF format if you require. Emaial me if so.

Topic: 22605 Message: 22622

twinHi Marinus,
And a very good morning, thank's for your msg!
Well, looking through the tubes caracteristics, I got the following results :

Max ratings Filament Cin (pf) Cgp Cout Class Plate Volt Screen volt Grid volt Plate I Grid I Drive level Power Out

2E26

Pdis 13.5 W
P volt 600 v
Sc dis 2.5 W
Sc volt 200 v
6.3 v 12.5 0.2 7 AB1 500 125 -15 22/150 0 0.36 56

6146B

Pdis 35 W
P volt 750 v
Sc dis 3 W
Sc volt 250
6.3 13 0.22 8.5 AB1 750 200 -48 50/250 0 0.4 125

Beside plate and screen voltages we see thazt the internal capacitances ares very near, and beside that the loading charge is 8 kohms for 2E26 and 7 kohms for thes 6146B (both for two tubes)
So as I did this substitution about 25 years ago on a 599 twin in order to use it on a portable station, the only thing I remember for sure is the fact that I did not had any problem with the substitution. Just the polar grid to change (-48 to -15), the plate voltage to reduce to half the normat value (850 to 500/550 volts) and readjust the neutrodining on 28 Mhz. The output was over 50 watts, and the 599 twin stayed in service at the summer shack until 1998 when we sold it.
Just hope that will help you!
73 Marinus good day!
F5UL, Bob

> Running with only one 6146/2001 I think is mentioned in the manual for lower power license operators, originally a kit was available, it allowed the single heater to work .(normally the heaters are in series). I think that is the only requirement.

Many thanks for this remark: I did find the note mentioning this.

Not knowing what is in the "low cost plug in module" (I think a dropping resistor between pin 2 and 7 for the heater voltage) has me researching another solution.

Basically some hams have resorted to using two 6883B's in parallel and wired the heaters in parallel rather than in series.

In order to make an "simple reversible" solution one may use a plug that for one tube which shorts pin 2 & 7 and put in the other socket a 6338B. The rest can be left the same but I am a bit wary about the reduced load raising the plate and screen voltages.

Please comment on this solution, what do the learned members of this group think of this approach?

Many thanks in advance, Marinus, ZL2ML

> F5UL, Bob

Bob, yes this is of help. It does require a bit of surgery on the rig, the bias and plate -should- not give too much problems but I see that also the screen voltage has to be dropped from 200 to 125. This means a bit more work than one would call "reversible in a pinch". At this moment I am contemplating the single 6883B solution since that should be almost a plug and away-you-are solution (I do expect having to neutralize again) Am a bit concerned about high voltage in the single tube solution but have not investigated yet if I can do something about that.

Topic: 22626 Message: 22626

I am in the process of buying a TS-830S, and I would like some info about the CW filters. I currently have a TS-530S (that I'm planning to sell) with a YK-88C 500 Hz CW filter installed in it. I was wondering if it would be worthwhile to remove the filter and put it in the TS-830S, or is the selectivity narrow enough for CW with the variable bandwidth available without any optional filters?
The specs I found online say the variable selectivity goes down to 500 Hz without any filters. Maybe the YK-88C would have a steeper bandpass shape?

Thanks for any info,
Al, WA2AS

>
> Is this to get 50W output?

Gordon, only just now did I realise I had not replied to your question, apologies.

I am not fussed about the maximum output, far more interested in longlivety of the rig and its tubes.

IMHO the transformer is underrated and the voltages are too high for continious duty (e.g. PSK-31). It's OK for casual SSB without voice compression.

I've got another transmitter and it has three transformers, each the size of the Kenwood one, and that runs only two 6146's (not B's) in the output.....

Mike,

Q4 will normally operate "warm" but not "hot". Q4 is the current regulator for the 9VDC supply.

If R22 (180 ohms) shows signs of overheating, replace it. I also would replace Q4 as well alone with D1 (WZ-061 6.1 volt 500ma zener).

I replaced both components in my 820's 9VDC supply. The 820 uses the same circuit except Q4 is a 2SA496Y as a current regulator. I suspect a 2SA496Y will work as a replacement for the 2SA606L. You can find the 2SA496Y at the following website for $1.00 (minimum order of $25):

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

Check C8, 47ufd 10VDC electrolytic capacitors, it may be shorted. If it is, I recommend increasing the voltage rating of the replacement capacitor to 25VDC. The original voltage rating of C8 does not provide an acceptable safety margin in a 9VDC supply, especially with the age of the 520.

22629. TS830S - no output after replacing finals

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-30 19:48:54 UTC
From: n1326e
Topic: 22629 Message: 22629

I've had this faithful friend for about 20 yrs and have been inactive on HF for the last 3 yrs. Recently, after firing it up into a dummy load, I saw no output power (never replaced any of the tubes)so decided to replace the driver and both finals to 6146W's. I still see no output power on any band (modified to transmit WARC many years ago). I do have good ALC indication on all BUT 7,18,29,29.5 band positions. I've cleaned the entire band selector switch, but no help.

My radio has never been kicked around,is very clean (non smoking) and never been mobile. Any ideas on where to start looking?

Thanks,
Tom

When you key the final,

1. Keying with a mic PTT in SSB do you have idle current on the finals?

2. Do you draw any plate current when peaking the driver in CW?

3. You didn't accidentally turn off the screen supply switch did you?

Hi,

I acquired a used 520 that also had the controls tight and
difficult to rotate.

I used a few drops of TriFlow lube into the bearing and let the
radio sit overnight on the side, this corrected the problem
and the controls are smooth as if the radio was new.

Hello Shaun,

If you adjusted VR2 on the RF UNIT board, you need to readjust VR2's setting so the voltage on T4's secondary center tap, in receive with the antenna disconnected, will be -3.5VDC.

Once the receive no-signal voltage is set to -3.5VDC and without changing VR2's setting, placing the 830 in transmit without RF output, the voltage at T4's secondary center tap should change to +1.3VDC.

You should also adjust VR1 so the voltage at the junction of one side of VR1 and C57 plus the junction of VR1's other side and C58 should be 2.5VDC in receive in both places. Adjusting VR1 should result in the voltage being the same at both places. Remember, the "2.5VDC" is in "receive" with no incoming signal applied to the antenna (remove the antenna). Without changing VR1's setting, placing the 830 in transmit, the voltages at both junctions should rise to +6.2VDC.

To see these voltages, download the high resolution schematic of the TS-830 at N6WK's website:

http://www.n6wk. com/kenwood/

Here's the link on N6WK's website for the high resolution schematic:

http://www.n6wk. com/kenwood/ TS-830S-excellen t%20schematic. pdf

James,

Thanks for this suggestion, cannot get the pin-point locally but I can get the 59ml (2 Oz) bottle. I'll get some later today, hopefully I will not have to pull it apart any more.

22634. VFO-520/VFO-820 Differences and the Interface cable

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-09-30 22:09:56 UTC
From: jmcgsd
Topic: 22634 Message: 22634

I have a VFO-520 at the moment,and have located a VFO-820. I have a couple of questions:
1. What are the differences between these VFOs?
2. The VFO-820 has no interface cable. It appears to be the same as my VFO-520, but I want to keep that cable with the 520. Any idea where to obtain the 9-pin connectors needed to make a cable?

Thanks and 73.
Joe

When I owned a TS-520S I fitted a "half-power" switch. It removed the voltage from and grounded one of the screen-grids thereby disabling one valve. It worked absolutely fine and gave no problems at all.

Hello Joe,

The differences between the two VFO is cosmetic/cabinet/dial designed, nothing more.

A VFO-520 will plug into and work with a TS-820 and vice verse, a VFO-820 will plug into and work with a TS-520/520S/520SE. No modifications required to either VFO.

Sorry, I have no idea where to find the 9 pin plugs. The cable itself is pin for pin, 1 to 1, 2 to 2, etc. No jumper/cross overs at either end.

There are instructions in the manual on how to run the TS520 at novice power levels.

Now I know this is probably of no practical use whatsoever but I bought several of these plugs when I was in Japan about a year and a half ago. I can probably even point you to almost exactly to the shop you need to go to in Akihabara!

At least they are available somewhere, even if not in your local area and are not made of "unobtainium"!

If the worst comes to the worst, consider retrofitting your VFOs with 9 Pin DIN sockets and then using your one "good" lead to make two leads with 9 Pin DIN plugs on one end???

Greg,

Many thanks for your reply.

Here are the test results:

1. Meter SW = IP
Mode = SSB
Send/Rec = Send
Mc50 - PTT depressed
Meter indicating 62 Ma
also indicating 62 Ma when PTT not depressed

2. Meter SW = IP
Mode = CW
Send/Rec=Send
Key = Down
Meter indicating 98 Ma
When Key = up Meter reading = 70Ma

3. SG switch = ON

Again, thanks for any help you may be able to provide.

Did this radio ever work correctly? If not, then having bad finals was not your only problem.

Does the radio work in the receive mode?

If so, and you push the PTT switch in sideband mode you are seeing approximately the correct quiescent plate current (~60ma).

The indication of 98ma in CW mode with the key depressed indicates little or no drive to the finals. Beyond that I cannot hazard to guess where the transmit circuits are not producing drive. It can be anything from the balanced modulator to the driver. If the receiver does not work as well, then it could be anything including the Oscillator/mixer circuits.

If you have test equipment and some one locally who knows how to troubleshoot that would be your best bet. Maybe you can contact a local club and find someone with experience fixing transceivers of this vintage.

Hello Tom,

First, the meter cannot and will not indicate anything other than the level of incoming signal in receive. RL1 on the AF UNIT prevents the meter from displaying any readings other than S Units in receive. Therefore, it's impossible to indicate ALC, IP, RF, and HV meter readings in receive, regardless of the meter switch position.

Check the RF gain control, it may be set a bit less than full clockwise setting.

I suspect your 830 is dirty and needs a good cleaning. Just cleaning the band switch is not enough especially since the 830 has sat for 3 years.

The PLL UNIT and the COUNTER ASSEMBLY both have 2 internal boards inside their metal enclosures. The boards connect to each other through a set of fixed pins inside the metal enclosures. If these pins get dirty/corroded the PLL UNIT and/or the COUNTER ASSEMBLY will not work properly.

Each board has a number of wiring harness plugs and the plugs and pins also get dirty.

So, thoroughly clean the 830 and test for operation on all bands.

73's
Mike W5RKL

Greg,

Oh yes, this radio has worked for me for many years, WAS, WAC and many DX stations over the years.

Also, the radio seems to work fine on RX mode on all bands.

Thanks again for your help.

Tom

Recently, after firing it up into a dummy load, I saw no output power (never replaced any of the tubes)so decided to replace the driver and both finals to 6146W's. I still see no output power on any band (modified to transmit WARC many years ago). I do have good ALC indication on all BUT 7,18,29,29.5 band positions. I've cleaned the entire band selector switch, but no help.

From: Greg Anders
Topic: 22629 Message: 22647

I would echo the comments someone else made regarding a complete "cleanup" before jumping to any troubleshooting extravaganza.

1. Remove, clean and reseat all connectors inside.

2. Clean bandswitch and mode switch with de-oxit (let the radio dry out well before applying power.

3. Loosen and re-tighten all screws holding the boards in place. You can be amazed how many are not tight and they make the groundplane contact work.

Gud luck, Kenwoods that go idle for sometime often have these issues.

Greg

Greg,

Oh yes, this radio has worked for me for many years, WAS, WAC and many DX stations over the years.

Also, the radio seems to work fine on RX mode on all bands.

Thanks again for your help.

Tom

Mike,

Good to hear from you. I've been watching this group for awhile and want to send my sincere thanks to you for helping others through your indepth knowledge of these Kenwood radios.

First I'll check the RF gain control position, don't remember what position it was in, AND....I have not cleaned the radio inside the areas you pointed out.....ever..... and didn't realize the PLL and Counter Assembly could be opened for cleaning. So, with your suggestion, I'm going to take this opportunity to open it up a bit more than cursury cleaning and clean those particular areas. It looks like I have my work cut out for me but it should be fun and a good learning experience.

Many thanks,
Tom

Perhaps a bad capacitor in the driver stage ?

Marinus, Zl2ML (restoring / enhancing preloved TS-520)

Hello Everyone

I am in need of the cable that connects the VFO-520 to a TS-520. Does anyone have one they would sell?

Or tell me where I might be able to purchase one?

Thanks
73, Rick VE3FMC

1. Meter SW = IP
Mode = SSB
Send/Rec = Send
Mc50 - PTT depressed
Meter indicating 62 Ma
also indicating 62 Ma when PTT not depressed

Sure you will get TX mode with or without PTT sw when you have the send/rec switch in the send position,,,,it IS a ptt switch !

To

Greg,

Many thanks for your reply.

Here are the test results:

1. Meter SW = IP
2. Meter SW = IP
Mode = CW
Send/Rec=Send
Key = Down
Meter indicating 98 Ma
When Key = up Meter reading = 70Ma

> WB3JHP

With the key down, does the IP change with the CAR control turned up/down, can you peak the reading by tuning the DRIVE control , Can you dip the IP by tuning the PLATE control? The increase of IP tells me that you may have some drive getting to the PA tubes grids.
Good Luck
JD

This is the same question that I asked yesterday. I would even be happy if I could buy the connectors, but I sure can't find them anywhere on the Internet. If I EVER see them at a hamfest or swap meet, I'm gonna buy every one in site!

Good luck with this.

Hello,

I would appreciate any comments regarding possibility of using WD40 for TS-830S fan lubrication. Is it ok? Or maybe, there is other kind of lubricant / oil that could perform better its duty.

Thank you in advance for your kind assistance.

Hi Guido,

WD40 will evaporate and leave you with a thicker oil than when it comes out of the can. May be better to use a sewing machine oil.

I confused your 830 with an 820.

The 830 PLL UNIT and COUNTER UNIT do not have 2 boards, only one each. The 830's PLL and COUNTER UNIT are connected to the wiring harness through various plugs so cleaning of the plugs and pins, checking all grounds including the board mounting screws, is important.

Sorry for confusing the 820 PLL UNIT and COUNTER UNIT enclosures with the 830. I still believe your problem is about dirty contacts.

WD40 is not a lubricant. It is a good cleaner and water displacement agent.
Machine oil such as 3in1, triflow, or just good old 5w30 motor oil is fine.

Hello Chris and Kevin,

Thank you for your messages.

I've found some sewing machine oil (it says "multiuse", though) viscosity ISO VG 10.

I think I'm going to use it on the fan.

Hi Guys. Sewing machine oil or 3-in 1 oil will work well for the fan motor. PLEASE do NOT use WD-40 on any electronic parts, circuit boards, electrical contacts, or plastic parts! It is not meant for use as a contact cleaner, and when used on the above mentioned things will cause problems. WD-40 is a penetrating agent for metals. it can corrode and destroy plastics, and cause other problems as well.

WD-40 is a good product when used as it is meant to be used for. It is NOT meant for use on or around electrical/electronic devices, nor is it meant to be used on or near plastics.

Guido,
NO.. Do NOT use WD-40.
It has very poor lubricating properties. use a good sewing machine oil
or some other very light weight oil.

22665. Re: TS830S - no output after replacing finals

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-02 16:26:52 UTC
From: Thomas C
Topic: 22629 Message: 22665

For one, if you want to see if there's TX output on SSB then you need to put an audio signal into the system. SSB suppresses the carrier.

Secondly, 70 mA when in CW mode is not a good sign when the key is down. In CW mode the idle current is about 70 mA. CW needs less linearity than SSB.

Thirdly, you're NOT monitoring the current in RECEIVE mode, you are seeing the AGC voltage.

Recently, after firing it up into a dummy load, I saw no output power (never replaced any of the tubes)so decided to replace the driver and both finals to 6146W's. I still see no output power on any band (modified to transmit WARC many years ago). I do have good ALC indication on all BUT 7,18,29,29.5 band positions. I've cleaned the entire band selector switch, but no help.

From: Greg Gollan
Topic: 22651 Message: 22666

I have used the base from the old driver tubes to make this cable. I used a Dremel wheel to cut glass tube and tops off the pins. Wires soldered easily to pins. I then filled the void with silicon and encased the whole assembly in heat shrink tubing. Worked and is still working great.

Before you try to make a connector out of a glass tube, go to http://www.apexelectronic.com/connectors.htm and look at part # CON6-W-9A. It is a cable assembly of some kind that is terminated in a 9-pin tube-style connector that will fit into 9-pin tube sockets. The good part is that it only costs $3.00. Use it like it is or modify it as needed or call them and ask if you can buy just the connector.

I have some of the standard 9 pin connectors available.
They have male prongs, just like a 12AU7 tube would have.
I have a total of three of them. Two have the "hood" to
hold the cable in. $12 each. One is missing the hood.
It is $10.

Prices do not include shipping from Florida.

Thanks.

I would encourage you to bring it up and check it out first. That way you know what condition it was in when it arrived.

PM?

Well, I have owned three 830S's. I always do the basics.

1. Pulll/clean and reseat all interconnect cables.

2. Loosen and re-tighten all pwb mounting screws (avoids squirrelly ground issues).

3. Check the fan and if it is not quiet pull it and clean/lube.

Great radios, enjoy,

Greg

Yes WD-40 is not to be used on any Radio part what so ever. I use a product called "Corrision Block" made by Lear Chemical Research Corp. in Canada. I found this product back in 91. It is made for the Marine industry for corrision control on all marine systems including electronics. I worked in a marine electronics shop and we sprayed all the boards in Radars, Depth Sounders, Radios ect. new and used. I will loosen rusted bolts much better than WD-40 and has no adverse reactions on any plastic except soft membrane keypads or LCD displays. I use it insted of De-Oxit on all controls, swtiches and fans. I have cleaned badly corroded boards on VHF radios that were dead and they came back to life. You can find it in most marine stores or online marine suppliers.

I was recently recommended using Tri-Flow Superior lubricant for loosening up the plate capacitor (seems to be stuck solidly) and I wonder if same can be used for the fan? Looks to me to be superior to sewing machine oil.

Thanks
Marinus, ZL2ML

hello to all & I hope this finds you well,

In an earlier e-mail someone referenced Ken's Electronics in Kalamazoo Michigan. He Has the 9 pin connex for $5 ea. & will ship for 4.95 USPS 1st class up to 13 ounces. Link is: www.kenselectronics.com
Also Mouser, R & L, and others can supply them without the need to cut up old tubes. I would bet Ken Kemski K4EAA has them as well (WWW.K4EAA.com).

Best of luck in your search and I hope you get the rigs connected & running.

Hello Marinus & all on the thread,

I concur; Tri-Flow is a very superior lube for many light machine oil applications. Slick -50 also makes a good light lube available in an aerosol can and while it is not as good as Tri-Flow it is pretty darn good. The key with any light oil is to use the minimum necessary to meet the need. Too much oil & it just gums up the works (not to mention migrating to other places on a circuit board where it may have undesirable effects & bad consequences.

You can usually find Tri-Flow or Slick-50 in the automotive section of a good hardware.

Best of luck.

22676. New TS-830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-03 00:12:14 UTC
From: Dick Merryman
Topic: 22655 Message: 22676

Well, it came in two boxes and took me an hour to unpack all the bubble wrap. I got a TS-830S, a VFO-230, a SP-230 and a no-name microphone.

The equipment was well packed and clean as a whistle.

I opened the transceiver and noted that the CW filters are missing although the seller said they were there. It has Chinese 6146Bs. No signs of overheating on the plate choke or cathode resistors. Everything looked fine so I buttoned it up and hooked it to an antenna.

The receiver is great. Low noise, nice tone and the VFO is smooth. Loaded up on 20M at a little over 100 watts into a dummy load.

I tried 40M but could only get about 50 watts. I loaded it several times but that was the best it would do. As I was staring at the wattmeter I noticed that the power was slowly creeping up. Then, suddenly, the Ip meter pegged, the pilot lights dimmed and the whole thing went dark. I could smell the smoke.

Ouch! I went to open a beer and check my e-mail. I figure that best case I'll need two finals, 4 cathode resisters and a line fuse. At worst I probably smoked the power supply.

Think I'll have another beer.

If you just want to do it the most difficult way possible try this:

Take some modeling clay and stick the end of a 12au7a or similar tube. Place some tinned copper wire in the pin locations. Then pour some hot glue in the mold. Let this harden. Then do it again and solder wire to the pins.

Or go full out and pour plaster in the clay then use that to make a full on mold and do the wire thing and use melted plastic to make a connector.

Have fun...

-Kevin

Hello Dick,

Sounds to me like a failure in the bias supply on the Rectifier Unit. Check capacitors C5 and C6 (33ufd 160VDC each capacitor) for internal shorts. Also check D5 on the Rectifier Unit to see if it's burnt open.

Also check the Final Unit's R2 thru R5 (20 ohm 1/2 watt each resistor)final tube cathode resistors. They may be smoked due to excessive current through the final tubes. Replace them if they appear to have been overheated, blistered, or cracked even if they measure 20 ohms.

I would also check the final tubes as well. The driver tube should be okay but it wouldn't hurt to check it as well.

Howdy Dick,
I had a little time ago, an TS-820. It'sn sold now but when it came in my hand, it has the same configuration as your 830! Chinese 6146B!!!
The first time I turned it on I got, in about 10/15 mn of test, the same results as you, bad smell, light off, fuse gone, etc.
Upon check, I foud the 4 20 ohms (R2 to R5) gone, one 6146b with the anode with a 5 cents hole vaporised in it.
So I did what you have to do, replace the two PA ntubes with RCA 6145W, 4 new 20 ohms resistors, one fuse, and just for the sake of beeing good a new 12BY7 too!
When I sold it 11 month laters, it was still working super good, more than 100 watts on 20 m and going good!
So at least with the hybrids transceivers (,Kenwood on Yaesu) beware of the chinese tubes (6146). They are cheep sure but for a good reason. The anode is realy thin steel plate, very fleemsy!. The disipation is far from 35 watts (may be only fot 10 second!!!). At 850 V / 230 mA, they go up very fast, with the anode going red quite fast...!

Good luck with the restoration of your 830. It's a great rig!

You can buy two-pack plastic resin fairly cheaply. My fiancee has tubs
of the stuff for making various small moulded plastic items. You'd
probably want some sort of thermosetting rather than thermoplastic
resin, so it didn't fall to bits when you soldered it.

Apparently you need proper silicone putty for the mould, because the
plastic sticks to plasticene.

JD,

I see your point and thanks for the input, however, I think my best course of action at this point will be to do a good cleaning job as suggested by others here. Then if I still have a problem, I'll be back to report and ask for more help.

Thanks again to all how have replied to me,

Tom

22685. TS-520 12 volt homebrew power cord.

Hello,

I have a power cord with the 12 pin Molex connect that I made when I had my TS-520. I no longer have the radio but stubbled across the cord when I was cleaning up my shop. It has the Molex on one end and Anderson PowerPoles on the other with about 4 to 5 foot of cord. I am offering it up for free to anyone who may want it. I will ship it out anywhere in the continental US only. This is truely free, I will cover the cost of shipping. I just hate to throw something perfectly good away. Please email me if you are interested.

Thanks,
Steve,
KD8AIV.

Please please ship it outside the US ;-)

If you stick it in a padded bag it should be fine. In fact, you could even just chop the TS-520 Molex and send that, and sling the wire. Let me know what postage to Glasgow, Scotland G61 1RE would be, if you're up for sending it out of the country.

22690. TS-820s blowing screen grid resistors.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-03 22:35:05 UTC
From: trippkj4bkd
Topic: 22690 Message: 22690

Hello,

The 10 Ohm screen grid resistors will blow all of a sudden while in idle with out pushing any kind of load. Happens sometimes while tunning the pie network. And sometimes while just in recieve. They have blown about four times now in less than two weeks. I always tune first into a dummy load. I replace them and they blow again. I am kind of stumped here. Im not sure what to check for.
One time it blew with the covers off the rig with the rig turned on its side. I saw a big spark and debree from one of the resitors hit my hand like shrapnel. No injuries but scared me just the same. Lateley while trying to tune I noticed I could dip the plate in Tune mode but not in CW. I also had no Load. I figured the screen grid resistors had blown again as they sometimes make no noise when going south. I really am concerned there is something very wrong with my final section or the HV Caps. Has anyone had simillar problems. I am at a loss here.

Thanks for any advice
Tripp KJ4BKD

The TS-820's 10 ohm 1 watt resistors are the final tube's "cathode" resistors not "screen grid" resistors. They blow because of excessive current flowing through the final tubes.

This can be caused by a number of things.

1. Short final tubes (one or both)

2. Bias supply has failed, tubes are not cut off in receive resulting in saturation current flowing in both final tubes.

3. Broken or intermittent bias circuit wiring to the final unit's "FG" terminal from the RF UNIT "FG" terminal.

4. Q5 on the RF UNIT has failed

5. Missing bias voltage at the RF UNIT's RF2 pin 7.

6. Bad bias pot

The HV caps have nothing to do with the cathode resistors burning up.

22694. RE: New TS-830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-04 06:28:11 UTC
From: Dick Merryman
Topic: 22629 Message: 22694

Well Guys, my new TS-830S is back on the air, fully operational.

The problem was a dirty CAR control. If I happened to stop adjusting it when it was right on the edge of a dirty spot, the drive would creep up and then avalanche, the finals would be way over driven and the line fuse would blow.

I fixed it by cleaning the pot with contact cleaner. I gave the rest of the radio a bath while I was in there. Visual inspection turned up nothing, all final voltages are right on and the cathode resistor array is exactly 5 ohms.

So I buttoned it up and put it back in service and made about 50 contacts tonight for the boys in the California QSO Party.

I ordered repair parts from K4EAA and will replace all the final resistors and caps and re-cap the power supply. I'll also replace the Chinese 6146Bs. I would replace the driver tube as well but have been advised that would necessitate an RF re-alignment. Too much trouble since its working fine.

While I'm replacing the parts I'll probably field-strip the whole radio and clean all of the connectors (there's dozens) and the grounding screws for the PC boards.

Thanks to everyone for all of the good suggestions and support.

Subject: New TS-830S

Well, it came in two boxes and took me an hour to unpack all the bubble wrap. I got a TS-830S, a VFO-230, a SP-230 and a no-name microphone.

The equipment was well packed and clean as a whistle.

I opened the transceiver and noted that the CW filters are missing although the seller said they were there. It has Chinese 6146Bs. No signs of overheating on the plate choke or cathode resistors. Everything looked fine so I buttoned it up and hooked it to an antenna.

The receiver is great. Low noise, nice tone and the VFO is smooth. Loaded up on 20M at a little over 100 watts into a dummy load.

I tried 40M but could only get about 50 watts. I loaded it several times but that was the best it would do. As I was staring at the wattmeter I noticed that the power was slowly creeping up. Then, suddenly, the Ip meter pegged, the pilot lights dimmed and the whole thing went dark. I could smell the smoke.

Ouch! I went to open a beer and check my e-mail. I figure that best case I'll need two finals, 4 cathode resisters and a line fuse. At worst I probably smoked the power supply.

Think I'll have another beer.

I will check theese things out as time permits. I guess Bias supply would mean Bias Voltage Supply and what should that be about 50 to 60 mv.

thanks again

simple start, read the manual....

find someone local who has one, to show you how to operate it

From: Frank VK5KV
Topic: 22706 Message: 22706

Howdy Group,

Has anyone connected the SM220 with BS5 to the location described in the SM220 manual??? Looking for comments and I cant figure how you can get it to work properly after the SSB Filter on the IF board. I have connected mine at the input point of the IF board which comes from the Noise Blanker board with good results, However RX sensitivity does suffer, anyone worked a fix for this as the BS5 seems to load down the input level to the IF Board even after adjustment of transformer sections in that area.

Cheers Frank VK5KV..

Tate-

The YG-455C-1, which is a YG-455C on a carrier board with connectors, will fit in the TS-830S if it is removed (unsolder) from its carrier board. The two filters are identical except for the carrier board. YG-455C-1 filters are readily available on eBay and elsewhere.

Malcolm-

Congratulations. The 520 is a great transceiver. That was my first rig and I still have it and use it alongside of my 1000MP.

First thing is to read and understand the manual. If you don't have one get it from http://www.kg6haf.com/kenwood.html .

Next, go to http://www.K4EAA.com and read everything on his entire web site. Pay particular attention to his instructions for loading up a Kenwood hybrid and to what to check if a hybrid is overdriven. Also, closely study all of his pictures and examples of what goes wrong and how best to fix it. Note that in addition to transceiver service he sells a variety of commonly needed repair parts.

Thirdly, open the case, top and bottom, including the final cage, and closely inspect everything using what you learned on K4EAA's site. This would be a good time to clean all pots and variable caps with contact cleaner and to loosen and re-tighten all of the screws that hold the PC boards down. These screws provide the ground path for the boards.

Finally, close it up, hook it to a dummy load, power it up and see if it loads. K4EAA's site will have taught you what to look for regarding failing final or driver tubes as well as power supply electrolytics.

Don't skip any steps. I just got a new TS-830S on Friday and managed to blow it up in the first 30 minutes because I didn't follow my own advice about cleaning the pots and caps.

OK, pal, have at it and enjoy yourself. Get that General upgrade and the whole world will open up to you. Then you'll notice that the Extra portion of the bands are generally less noisy and you'll have to upgrade again. A month should be sufficient!

The very best 73,

-Dick-

<snip>

You left out old age ;-)

These rigs are 20 years old *at least* now. The carbon comp resistors in the PA have had a good life. Time to get some nice new metal film ones.

Incidentally, when the carbon comp resistors in my TS-520 crumbled and fell apart, I could only find 10ohm 2W wirewounds and 1/4W metal film 22 ohm resistors. I stuck four of the 1/4W resistors in and ran the PA up to about 25W. There was no appreciable RF across the cathode resistor, unsurprising since it's heavily decoupled by C8, C9, C10, C11, C12 and C13. Now, you can't use wirewounds with RF, but since there wasn't really any RF there I reasoned that the wirewounds would be okay. So, I fitted them, and on turning the wick up there was *still* no RF across them and a lovely clean output with no significant harmonics or weirdness. The only thing is that they are a higher power rating, which I'm a little unhappy about because as has been pointed out they are designed to fail preferentially.

The 10 ohm 1W metal film resistors have now arrived, but I'm unlikely to fire up the TS-520 before I move house (to a nice little farm cottage with a big garden and only one near neighbour who doesn't own a plasma

TV). I'll fit them before I give it any serious use again.

Hello Tripp,

Yes, bias supply means bias voltage supply. The bias supply is located on the Rectifier Unit on the bottom of the TS-820 next to the power transformer. The bias supply output is labeled "-C" on the TS-820 Rectifier Unit schematic.

The bias supply produces a "negative" voltage of approximately -100 volts DC or so, not "mv" (milli-volts).

The bias control located on the rear of the TS-820 controls the level bias voltage applied to the final tube grids for the final tube's normal no signal transmit idling current of 60ma (see the TS-820 operating manual for details).

If you do not have the TS-820 operating and service manuals, I recommend download them from N6WK's website at

http://www.n6wk.com/kenwood/

Scroll down the page and click on the appropriate link. The files are in pdf format which requires the Adobe reader to view the files.

If your technical, troubleshooting, and repair skills are limited then may I recommend enlisting the help of a local ham who has the necessary skills to help you troubleshoot and repair your TS-820.

22712. TS-530S Distorted TX Audio

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-05 15:18:28 UTC
From: ah6rr1
Topic: 22712 Message: 22712

A while back I had posted a problem with a 530 that had distorted audio on transmit. I got a few sugestions on what could be the problem, microphone ect. Well I found the problem the HV caps were weak when you turned the rig on the HV would go to 750V then climb to 800V slowly. As soon as you turned the radio of the voltage dropped to 0 almost instantly. So I ordered replacement caps since I was at it I ordered replacement eletrolitic caps for all the boards and replaced them as well.
Now when I turn the rig on the HV goes to 900V no load and runs 825-850V on TX there is no distorted audio. I am getting 125W PEP out and getting great Kenwood audio reports.
I repainted (sprayed) the cabinet with some Rust-Stop I had matched at ACE, 1 quart for $10, nobody wants to ship matching paint to Hawaii :-(. It is a slight bit darker than the factory but looks fantasic. I also found a Rustoleum product the is a very close match to the face plate and touched that up as well. Added some new stainless steel screws and the radio looks and works like a shiney new penny. Now I need to find what to use the rest of the quart of paint on.

I just bought a TS-520 at a hamfest.... my first "older rig", and I'm a newbie to this reflector. I wanted to try a restoration project, and this TS-520 was so nice-looking I couldn't resist. Going through it, the worst problem I see so far is what seem to be broadcast station "images" in the 80M band. My friend Chuck (who is patiently trying to teach me troubleshooting and repair methods) thinks the problem may be in the ant trap circuit. The more I see of this hybrid rig, the better I like it.... I guess I've been "Kenwood - deprived" all these years.... 8^)

It doesn't have the optional CW crystal filter, and the manual indicates a YG-3395C CW Filter is correct. How narrow is this filter, and where can I get one? Can I use the T-88C I see on ebay in the TS-520?

Mike,

Well, I've finished the cleaning and resecuring of ground screws and the problem continues. Also, now the freq. readout doesn't follow the VFO so I've bumped or changed something. I tried to disconnect and reconnect the various PLL and Counter plugs again but no help.

Any further suggestions?

I have had my TS520 since new, never noticed any "ant trap" kind of circuit in it.
I HAVE heard third harmonic of AM 1270 station that was 5 kW, 4 miles from me, on 80M.Third harmonics of AM transmitters on 1160-1300 fall on 80M band.\
I see you are 19 miles from KYW 1060, who runs 50KW ! also within 13-19 miles of stations on 860, 950,990 kHz, all over 10 kW ;who could be mixing signals in some metal junction near you.
Good luck with the 520, mine has been a workhorse and really trouble free. The worse thing for the hybrids is letting them sit idle.

If you friend Chuck is referring the T6 and T7 coils on the TS-520's RF UNIT then those are not commercial signal traps.

T6 and T7 on the TS-520's RF UNIT are traps for the 8.395Mhz (T6) and 8.895Mhz (T7) signals (See the TS-520S service manual, page 48, paragraph 8 for details on adjusting both coils).

Yes, that is the original Kenwood CW filter. The original Kenwood filter has a bandwidth of 500hz. Unfortunately, that filter is no longer available "new" from Kenwood. You can find them quite often "used" on eBay and other ham forum sales sections. However, you can obtain a "new" and much better CW filter through INRAD. See the following website link for details.

www.inrad.net/

The INRAD filter is slightly larger than the original Kenwood filter. I have installed a number of these filters in 520 and 530 radios and I can say they do an excellent job in CW.

> How narrow is this
> filter, and where can I get one? Can I use the T-88C I see on ebay
> in the TS-520?

My recommendation is to purchase a new INRAD filter instead of a "used" filter, but that's me. Ultimately it's up to you which one you choose.

>
> 73, Jerry K3BZ
>
> [Non-text portions of this message have been removed]
>

I recommend going over the 520, performing a thorough visual inspection. You would be surprised what problems you can find by simply performing a thorough visual inspection.

I've found bad capacitors, burnt resistors, and poor soldering connection made by previous owners through a thorough visual inspections. I do not recommend applying power until this has been done and you are certain there are no serious problems that could result in abnormal operation that could end up smoking resistors, blow up capacitors, and/or damage the power transformer. Always check the front panel switches, especially the "SEND" switch before applying power! Don't relay on the seller's comments, "it works great! I had it on last night!" Also do relay on how good a radio looks. I've seen radios that look like they just came out of the factory yet when power is applied, the dreaded "snap, crackle, pop, bang, and smoke flows out" occurs! Do your thorough visual inspection homework first!

When inspecting filter capacitors, any capacitor that has a bulge or broken blister on one end, that capacitor should be replaced. The bulge or broken blister are caused by excessive heat pressure build up inside the capacitor from over stressing the power supply the capacitor is in. Age also can result in increase leakage current which can cause the same symptoms.

The HV filter capacitors, C19 and C20, are located directly behind the VFO. When replacing these capacitors, replace the equalizing resistors (470K 1/2 watt) and both disc capacitors (.01ufd 1KV). The original disc caps are rated at 500VDC so I recommend increasing the voltage rating of these disc caps to 1KV each. Ken, K4EAA (k4eaa.com), sells a HV filter capacitor replacement kit.

The bias supply, located on the Rectifier Unit, has two 33ufd 160VDC axial lead capacitors. I recommend replacing these with new caps as well. Mouser electronics sells these caps.

I also recommend replacing C20 and C21, both 2200ufd 16VDC, filter capacitors. These capacitors are the filter caps for the 14VDC supply. The 14VDC supply powers numerous circuits and both relays, plus it is the base supply for the 3VDC and 9VDC supply that is on the FIX AVR UNIT. Most 520's I've seen, the voltage rating for C20 and C21 has been "16VDC". I recommend increasing that voltage rating to 25VDC.

The 210A/210B/300A/300B filter capacitors, C15 and C16, (located under the VOX UNIT PC board, left top rear) each can has two 22ufd 450VDC capacitors inside (dual capacitor cans), are no longer available. To replace these capacitors, C15 and C16, individual 22ufd 450VDC capacitors must be used.

Check the tubes, 12BY7 driver and both 6146 final tubes for shorts and conduction.

Clean all the dust and dirt from the final cage cooling fan blades and the final cage components. Do not forget to clean the band switch wafers inside the final cage with contact cleaner.

Remove both relays, one is located under the VOX UNIT and the other is located under the FINAL UNIT between the final unit PC board and the rear panel, small metal enclosure. Clean the contacts and reinstall the relays.

I always recommend using canned air, available at Walmart, to remove dust, dirt, and excess contact cleaner.

Ensure all grounds are clean and tight, whether they are attached to a screw to the chassis or the PC board mounting screws. Over time, those grounds and mounting screws will come loose resulting in erratic behavior. Your choice of cleaner is up to you, I use DeoXit.

Same as the TS-830S except it has the AM board and a 6 kHz AM filter. The 830M was never distributed in the U. S.

I found the Digital Readout problem and it was ME !!!! I inadvertantly depressed the DH button while doing the cleaning. But the other original problems remain....on to the next step I guess. Please advise.

Tom

Going through it, the worst problem I see so far is what seem to be broadcast station "images" in the 80M band. My friend Chuck (who is patiently trying to teach me troubleshooting and repair methods) thinks the problem may be in the ant trap circuit.

If you friend Chuck is referring the T6 and T7 coils on the TS-520's RF UNIT then those are not commercial signal traps.

T6 and T7 on the TS-520's RF UNIT are traps for the 8.395Mhz (T6) and 8.895Mhz (T7) signals (See the TS-520S service manual, page 48, paragraph 8 for details on adjusting both coils).

> The more I see of this hybrid rig, the better I like it.... I guess
> I've been "Kenwood - deprived" all these years.... 8^)
>
> It doesn't have the optional CW crystal filter, and the manual
> indicates a YG-3395C CW Filter is correct.

Yes, that is the original Kenwood CW filter. The original Kenwood filter has a bandwidth of 500hz. Unfortunately, that filter is no longer available "new" from Kenwood. You can find them quite often "used" on eBay and other ham forum sales sections. However, you can obtain a "new" and much better CW filter through INRAD. See the following website link for details.

www.inrad.net/

The INRAD filter is slightly larger than the original Kenwood filter. I have installed a number of these filters in 520 and 530 radios and I can say they do an excellent job in CW.

> How narrow is this
> filter, and where can I get one? Can I use the T-88C I see on ebay
> in the TS-520?

My recommendation is to purchase a new INRAD filter instead of a "used" filter, but that's me. Ultimately it's up to you which one you choose.

>

>
> [Non-text portions of this message have been removed]
>

I recommend going over the 520, performing a thorough visual inspection. You would be surprised what problems you can find by simply performing a thorough visual inspection. I've found bad capacitors, burnt resistors, and poor soldering connection made by previous owners through a thorough visual inspections. I do not recommend applying power until this has been done and you are certain there are no serious problems that could result in abnormal operation that could end up smoking resistors, blow up capacitors, and/or damage the power transformer. Always check the front panel switches, especially the "SEND" switch before applying power! Don't relay on the seller's comments, "it works great! I had it on last night!" Also do relay on how good a radio looks. I've seen radios that look like they just came out of the factory yet when power is applied, the dreaded "snap, crackle, pop, bang, and smoke flows out" occurs! Do your thorough visual inspection homework first!

When inspecting filter capacitors, any capacitor that has a bulge or broken blister on one end, that capacitor should be replaced. The bulge or broken blister are caused by excessive heat pressure build up inside the capacitor from over stressing the power supply the capacitor is in. Age also can result in increase leakage current which can cause the same symptoms.

The HV filter capacitors, C19 and C20, are located directly behind the VFO. When replacing these capacitors, replace the equalizing resistors (470K 1/2 watt) and both disc capacitors (.01ufd 1KV). The original disc caps are rated at 500VDC so I recommend increasing the voltage rating of these disc caps to 1KV each. Ken, K4EAA (k4eaa.com), sells a HV filter capacitor replacement kit.

The bias supply, located on the Rectifier Unit, has two 33ufd 160VDC axial lead capacitors. I recommend replacing these with new caps as well. Mouser electronics sells these caps.

I also recommend replacing C20 and C21, both 2200ufd 16VDC, filter capacitors. These capacitors are the filter caps for the 14VDC supply. The 14VDC supply powers numerous circuits and both relays, plus it is the base supply for the 3VDC and 9VDC supply that is on the FIX AVR UNIT. Most 520's I've seen, the voltage rating for C20 and C21 has been "16VDC". I recommend increasing that voltage rating to 25VDC.

The 210A/210B/300A/300B filter capacitors, C15 and C16, (located under the VOX UNIT PC board, left top rear) each can has two 22ufd 450VDC capacitors inside (dual capacitor cans), are no longer available. To replace these capacitors, C15 and C16, individual 22ufd 450VDC capacitors must be used.

Check the tubes, 12BY7 driver and both 6146 final tubes for shorts and conduction.

Clean all the dust and dirt from the final cage cooling fan blades and the final cage components. Do not forget to clean the band switch wafers inside the final cage with contact cleaner.

Remove both relays, one is located under the VOX UNIT and the other is located under the FINAL UNIT between the final unit PC board and the rear panel, small metal enclosure. Clean the contacts and reinstall the relays.

I always recommend using canned air, available at Walmart, to remove dust, dirt, and excess contact cleaner.

Ensure all grounds are clean and tight, whether they are attached to a screw to the chassis or the PC board mounting screws. Over time, those grounds and mounting screws will come loose resulting in erratic behavior. Your choice of cleaner is up to you, I use DeoXit.

On page 28 of the 520 manual, the Receiver section refers to theincoming signal being "fed through the antenna coil". The Block Diagram (Fig. 12) on page 29 shows the incoming signal travelling through a "trap coil" on its way to the RF amp. I put these two together and came up with "ant trap circuit".... sorry.

22730. RF output meter not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-06 16:35:47 UTC
From: scott_n2ddd
Topic: 22730 Message: 22730

Hello Everyone,
I have a TS-830S. Output power is 100W+ but the RF meter on the rig does not move. The meter works in every other position. I cleaned the METER switch and the RF VOLT pot on the back, but it did not help. Any thoughts/ideas?
Thanks for any input!
73 Scott N2DDD

22731. Re: [TS-520_820_530_830] RF output meter not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-06 17:10:31 UTC
From: Ken Winterling
Topic: 22730 Message: 22731

Scott,

If the meter is working in other modes and you have cleaned the RF position of the meter switch the fault is likely in the relative RF output detector or the interconnecting wiring. There are only a few components involved in the RF detector.

Take a look at the schematic and find the ANT jack on the right side just above the EXT VFO and X.VTER jacks. Just above the ANT jack is the T/R relay, RL1-1, contacts. The RF detector circuitry is just to the left of the ANT jack and RL1-1 and consists of two fixed resistors, two caps, and a 1N60 germanium diode, as well as the pot you already cleaned.

The diode is probably the culprit but you should also check the values of the resistors while you are in there as well as all of the solder joints. If you don't have a 1N60 you could substitute a 1N34A.

Good luck and report back what you find to be the problem.

Ken, WA2LBI

hello
i have the ts 520 kenwood when i go to cw mode and tune the rf output the meter goes all the way over is that right everyone is giving me great signal auto audio reports.

Sounds like the meter needs calibrating. Do you have a external power meter to see what it is actually transmitting?

Bob,

What is the position of the meter switch when you are doing what you
describe? If it is in the RF position then you should adjust RF VOLT
control on the left side of the rig to reduce the relative output reading.

Topic: 22730 Message: 22735

Hello Scott,

Check D5, 1N60, RF meter rectifier diode, it's most likely blown (open).

To see the path the RF travels which includes through D5, download the TS-830S high resolution schematic. See the link below.

http://www.n6wk.com/kenwood/TS-830S-excellent%20schematic.pdf

D5 is near the "ANT" connector on the upper right corner of the schematic. You will have to trace the path from D5 to the meter switch S13 then on to the AF UNIT plug 7 pin 2, through AF UNIT's relay RL1 terminals, and back out plug 7 pin 6 to the meter.

By the way, RL1 on the AF UNIT is shown in "receive" not "transmit".

Check the meter settings at the bottom right of the schematic. This will help you trace the switch wiring.

I agree with Ken, most likely the meter pot is improperly set.

Another thing to remember. The "RF" meter position is not a watt meter. The RF meter position simply displays a relative level of RF output. The circuit consist of a diode, a resistor, a pot, and a bypass capacitor. The fixed resistor lowers the RF signal that is applied to the diode. The diode rectifies the RF into a DC voltage that is fed to the meter and the pot, both which are in parallel with one another, displaying a relative level of RF that is being applied to the antenna, nothing more.

Bob,

You still haven't told us the position of the meter switch. The group needs that information in order to help you otherwise we are guessing. If the meter switch is in the RF position you won't hurt the transmitter but you are needlessly stressing the meter by causing it to slam against the right side pin. This may lead to meter failure.

Now would be a good time for you to review the TS-520 tune up procedure. Here is a good link for the procedure: http://www.k4eaa.com/tune-up.htm. Ken, K4EAA, has a lot of other good information at his site, http://www.k4eaa.com/

ok sorry ken i thought explained it ok the mode is cw and the meter switch
is set to rf to ajust the rf output everything else is ok the bias is set at
60 ma and plate dips ok.

From: w5rkl
Topic: 22732 Message: 22742

The MODE switch has nothing to do with the RF Meter switch position. Any RF present at the 520's antenna SO-239 will be displayed on the meter, when the meter switch is set to RF, regardless of the MODE switch position. The RF meter settings simply displays "relative" RF voltage output from the transmitter and should not be thought of as a watt meter.

The RF Voltage pot on the left side of the 520, controls the level of RF voltage displayed on the meter when the meter switch set to "RF".

If the meter switch is set to RF and the 520 is tuned for maximum output and the meter pegs full scale to the right, simply turn the RF Voltage pot down so the meter is no more than 2/3 of full scale.

Hi Rick,
Did you ever get a cable?
I have enough connectors to make up 3 cables. These are very nice connectors with little screw on covers. Very nice Quality.
I will sell each cable for $25.00 plus shipping. If you are still interested, please let me know. I will make each cable 24" in length.

Gordon,

Is the cable you use flexible or is it stiff? My VFO-820 cable is quite stiff which makes it difficult to keep it plugged into the 820. Any movement of the 820 or VFO-820 usually results in the cable being pulling out of the 820 by the stiff cable.

I think Kenwood used the stiffest cable they could find and the flimsy'est connectors on the back of the radios and VFO's. My 520SE and 520 VFO will become unplugged and "frequency dead" if I breathe on them. I love my Kenwoods but they flunk on their cable/connector design in this regard.

Hi Mike,
It is actually quite flexible for a 9 wire cable with a shield.
I don't think moving the gear would make it come unplugged.

Topic: 22651 Message: 22748

Those cables get stiffer with age, the connectors are not adequate to take any kind of torque from a cable that has formed itself into a shape already. The connectors can't hold if you move the transceiver or VFO more than ¼ inch in my estimation. I found this to be true even for the 803S and its VFO although Kenwood did use a slightly better connector/socket. I just live with it and don't move things without re-checking connections.

FYI

Greg

Hi Les,
No problem, TS-830S VFO cable it will be.
How long do you want it to be?
I have to pick up more cable tomorrow.
I will mail it on Thursday to you.
Priority Mail shipping will be $4.80

IF you are SURE it is tuned to resonance , since your meter is pinned , then the only real problem would be a chance of damaging the meter .

The adjustment they are describing is a very simple one that only requires turning a control a fraction of a turn , and it is not super critical , if you happen to overshoot it one way or the other , it is not going to kill your radio .

I don't remember the inside of mine since I haven't had to open it but once since I owned it , but these guys are the best I have EVER seen on these particular radios and can easily "talk" a person through it in a matter of a few minutes , that has never done anything like it before in their life .

OK, Gordon. Well, lengthwise, what do you recommend? Longer than stock, certainly, so what has been working for you? I was thinking 30"? 3 feet? Or does that seem too cumbersome?

Bob,

Have you adjusted the RF voltage pot that is accessible through the small panel on the left side of the 520? This is discussed in the 520's operator's manual. You do not have to open up the 520 by removing the top and bottom cabinets then search for a pot. It only takes a minute to do and your full scale RF meter setting will be fixed.

22760. ts 830s- no display, no receive.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-07 01:53:59 UTC
From: ve3ptc57
Topic: 22760 Message: 22760

i picked up a mint condx ts 830s a couple weeks ago. i never should have sold my last one !!
anyhoo, sitting in the shack, listening to 40m, i hear a loud click from a relay, and the display goes blank, and no receive. moving the band switch does nothing, and i can see 2 parallel lines on the display, very dim though.
first thought was pll board, as this supplys the display etc. i changed out the board for a known good one, and no difference. now im thinking the power supply af.avr board.
anyone come across this problem ?? the radio is such a beauty, i just have to get it going again!

Bob, swapping boards without determining what the cause of the problem is can easily result in damaging the known good board.

I recommend checking the following voltages:

1. AF UNIT terminal labeled "14". Voltage should be approximately 14VDC

2. AF UNIT terminal labeled "12". Voltage should be approximately 12VDC

3. AF UNIT TP-6. Voltage should be quite close to 9.0VDC.

The Counter Unit, RF Unit, AF Unit, and IF Unit will not work which results in no digital display and no receive and transmit. The PLL Unit is powered by the 9VDC supply which, by the way, is produced from the 12VDC supply. The 12VDC supply is produced from the 14VDC supply. So, as you can see, if the 14VDC supply fails, the 9VDC and 12VDC supplies also fail.

Ken and Mike,
Thank you very much for your input.
I do see that diode in the schematic
and on a connection strip in the final cage.
I will get a new 1N60 and replace it this weekend.
Thanks again and I will report back with the results.

The above should read

"If the 12VDC is missing a the AF UNIT's terminal "12" then the Counter Unit, RF Unit, AF Unit, and IF Unit will not work which results in no digital display and no receive and no transmit".

Does the unwanted signal peak when you adjust the drive tuning ,If so the signal is real and on the air on 3870 !
It can not be eliminated at your end. It is the fault of the AMBC station's transmitter.

Isn't the input trap circuit supposed to filter those out? I was thinking that the input trap circuit might be misaligned.
My other receivers don't have that problem.

Sorry but there is no "first harmonic" that = fundamental. Fundamental freq X 2 = 2nd harmonic, at least the way Iearned it at DeVry Tech school .....

2nd Harmonic - not 3rd.

transmit/fundamenta l - 1290 KHz
1st harmonic - 2580 KHz
2nd harmonic - 3870 KHz

This is the 3rd harmonic, not an "image" at all. Do the math.
Get in touch of the chief engr and see if he will put a trap in the output circuit ! Should be easy to do, simple parallel coil and cpacitor, and will knock them out of 75M !

Yep, I have a pair of 520's not the "s" . Both have an image of WHIO on 1290 (less than 2 miles from me) on 3870-3872. dang, i have to go to my brothers house to listen to the "Marconi net" hi hi. who cares....the rest of the band plays great.

I have had my TS520 since new, never noticed any "ant trap" kind of circuit in it.
I HAVE heard third harmonic of AM 1270 station that was 5 kW, 4 miles from me, on 80M.Third

harmonics of AM transmitters on 1160-1300 fall on 80M band.\
I see you are 19 miles from KYW 1060, who runs 50KW ! also within 13-19 miles of stations on 860, 950,990 kHz, all over 10 kW ;who could be mixing signals in some metal junction near you.
Good luck with the 520, mine has been a workhorse and really trouble free. The worse thing for the hybrids is letting them sit idle.
73.....JD

--- On Mon, 10/5/09, Jerry Keller <k3bz@...> wrote:

I just bought a TS-520 at a hamfest.... my first "older rig", , the worst problem I see so far is what seem to be broadcast station "images" in the 80M band. My friend Chuck (who is patiently trying to teach me troubleshooting and repair methods) thinks the problem may be in the ant trap circuit. 73, Jerry K3BZ

Scott,

The new diode's banded lead (Cathode) connects to C11 and the other lead connects to the junction of R23 and C30. Just make sure you connect the new diode this way.

22768. DEAD KENWOOD TS-830

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-07 15:43:30 UTC
From: campbellgc@bellsouth.net
Topic: 22768 Message: 22768

Folks....I am presenting here the obituary of my Kenwood TS-830.I have given up, in trying to get it back in operating condition even after a lot of help from Mike W5RKL.The basic problem is on the RF circuit board.I believe, that in the manufacture of the circuit board in Japan, when I purchased the rig back in 1982 was corrupt as over the years I have had to resolder so many "volcano" solder joints. I have also had to hard wire connections 5,6 7 9,DRIVE on VC . In addition,the connection numbered 2 on the RF board needs to be hard wired as the connection causes the display lights to be intermittent There is a short somewhere on the RF circuit board as there is no drive voltage,about 200v, getting from the 12by7 drive tube to the finals. I probably have caused a short with so many resoldered points on the under side of the RF circuit board....Perhaps an all new RF board may fix the problem...I just do not have any more patience in removing and replacing the RF board..Also resister R-11 on the rectifier board keeps blowing from the "phantom short"
The TS-830 has FT filters YF88H2.1 and YF455H2.1 installed A VFO-230 goes with the TS-830 along with a MC-50 Microphone.Also, all the operating and service manuals, all my notes on the repairs over the years.
Do I hear any offers,plus shipping?

Date: 2009-10-07 15:52:54 UTC
From: scott_n2ddd
Topic: 22730 Message: 22769

Update:
I just unhooked one end of the diode
and tested it with an ohm meter.
In one direction it showed ~1900 ohms,
in the other direction it showed infinity.
I compared those readings to some other
diodes I have here and they were about the same.
Do these readings indicate a functional diode?
Thoughts/ideas?

Hi Rick,
Did you ever get a cable?
I have enough connectors to make up 3 cables. These are very nice connectors
with little screw on covers. Very nice Quality.
I will sell each cable for $25.00 plus shipping. If you are still
interested, please let me know. I will make each cable 24" in length.

From: w5rkl
Topic: 22730 Message: 22773

Yes it does indicate a good diode. If the diode is good then there is most likely a break in the wiring or wire to the meter switch etc.

There isn't much that can go wrong with this circuit. As you can see in the schematic, the circuit is simple.

Check the simple circuit wiring including the meter switch.

Further on the VFO and Display problem:
At zero on the VFO on 160 it reads 1.5000 at 200 0n the vfo the display goes to 1.000 and stays there over the rest of the vfo range. Every band starts out abt right then goes to .000 depending on the band ie 14.000 28.000 etc

Not so! It can be eliminated or greatly attenuated at the receiving end by a simple tuned circuit. Look in any ARRL handbook for BCI and it will discuss how this is reduced. It's not necessarily a problem with the BC transmitter. Close proximity is a cause for overload on the tx and harmonic frequencies and need not be a "problem" at the transmitter site though it can be (rarely).

Hello all

Thanks to all the quick responses.

I have gone thru the checking of the voltages on the Rectifier Board (X43-1090-02) and yes I realize thanks to you guys that I am blowing cathode resitors and not scren grid resistors.

Here are my findings.
AC14V pin-15.7
14V pin-15.7
100V pin-88.2
210V pin-248
300V pin-248
AC800V pin-Off the scale of Senior VoltOhlmyst meter that is not very accurate anyway. Need to recalibrate this old meter.
800V pin- Could get no reading.
Now just to be clear all measurements were read in AC. Should I have read for DC on pins not marked AC?.

Here is whare it gets interesting.
300V A/B pin-742 very quick measurement on 500v scale of DVM.
210V A/B pin-560
-C pin- 253V DC
I do not have access to an Elmer to help me with this so please bare with me. Should I remove Rectifier board and check components such as resistors, capacitors and diodes removed from board?. I tried reading resistors while they are still mounted on board but could not get a reading except for R9 100K Ohm that showed 640 Ohms. What really scares me is what is causeing Rectifier board to go bad if theese measurements are even slightly accurate.

Any advice please.
Tripp KJ4BKD

22783. Meter/Needle Light Bulb For Kenwood TS-830S

The reason for my suspecting the BC transmitter is from real-world experience.
When I was working at WXYZ, I mentioned to the chief engr that I was receiving our third harmonic at S7 levels in several different receivers at my house, 4 mies away.
 So he found a big capacitor and coil and we installed at the output of the transmitter.
 We then tuned this trap for minimum 3rd harmonic with a spectrum anlyzer.
When I got home I measured the signal and it was just barely detectable.
True story!!!

Not so! It can be eliminated or greatly attenuated at the receiving end by a simple tuned circuit. Look in any ARRL handbook for BCI and it will discuss how this is reduced. It's not necessarily a problem with the BC transmitter. Close proximity is a cause for overload on the tx and harmonic frequencies and need not be a "problem" at the transmitter site though it can be (rarely).

Date: 2009-10-08 13:18:51 UTC
From: douglaselick
Topic: 22788 Message: 22788

I need to place an order to Mouser or Digikey for a few parts and thought I'd grab a proper set of tuning tools to align/neutralize my TS-830. Off the top of my head I can't remember what size I need and I'm nowhere near my rig at the moment. Are all the adjustments "flat blade" or are some of the slugs hex drive. If so, what size?

Non-conductive, not anti-static of course!

Thanks,

Doug/KC8HQX

My best advice is to buy a kit with all sizes of hex headed and bladed plastic tools. The last time I bought a new set two years ago I got them from Antique Electronic Supply in Tempe (www.tubesandmore.com<http://www.tubesandmore.com>). Their kit has sizes for everything from modern miniature slotted and hex coils to Boatanchors.

It should be fine, you need 4 (I think) and you will have to add the appropriate resistor for 12V. Little more work but should last longer, be brighter and look original. That being said, getting the lights from Ken isn't a bad idea either, just thought I would give you a second option.

22796. Speech Processor Quit working 0n TS-530

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-08 17:14:00 UTC
From: ah6rr1
Topic: 22796 Message: 22796

Yesterday my speech processor on my 530 quit working totaly when I press the processor button I get nothing out. The TX audio is fine until the Proc button is pushed. I will open it up and check Q14 since that seems to be the Proc preamp. Is there anything else I should check while I am in there? I did recently replace all the electrolytic caps and the processor was working fine but when I tried it yesterday zip. So any suggestions on where else to check would be welcome.

Thanks
Roland AH6RR

Does the 530 have a separate processor board? If not and its on a main board or IF board I would remove, clean and reseat any connector that is used for the processor circuit. 90+% pf Kenwood failures are connector issues in case you were not aware.

Subject: [TS-520_820_530_830] Speech Processor Quit working 0n TS-530

Yesterday my speech processor on my 530 quit working totaly when I press the processor button I get nothing out. The TX audio is fine until the Proc button is pushed. I will open it up and check Q14 since that seems to be the Proc preamp. Is there anything else I should check while I am in there? I did recently replace all the electrolytic caps and the processor was working fine but when I tried it yesterday zip. So any suggestions on where else to check would be welcome.

Thanks
Roland AH6RR

22802. WTB: 12 VDC "bolt on" power supply for Kenwood TS-520s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-08 20:09:26 UTC
From: Howard Weinstein
Topic: 22685 Message: 22802

Gang,

The End of the World is scheduled for December 21, 2012.

Therefore I am assuming that we will have difficulty accessing the 120 VAC Mains on or after that date..

I would like to purchase a 12 VDC bolt on power supply for the Kenwood TS-520s. I am also interested in a TS-520s in very good or better shape with the 12 VDC supply already attached.

If you can assist me in this endeavour please contact me off list.

hi mike, mni tnx for reply/info. i checked the af board as suggested, and im confused. i see 12.26 volts at terminal 12, and 8.95 volts at tp6, but nothing at terminal 14 ?
i think im going to remove the power supply, and the af/avr board, and have an electrician look at it for me.
again, many thanks for info/help.

Well replacing Q14 did not help. I checked the swtich and it was ok then started going over the board and it looked fine traced to the AF board and found the voltage at Q30 on the AF board had 3.2 volts with out the processor and -5.98 with the processor in. Could this be the problem area?

From: Greg Anders
Topic: 22796 Message: 22805

According to the Service Manual, Q13 (a SIP op amp with seven pins) IS the compressor and Q14 is an output buffer. If you have the processor off the mic line goes out of Q12 to a connector on the board marked (10). It's a seven pin connector (pin6 for normal audio). If you turn on the processor the audio from Q12 goes first to Q13 the compressor IC then to Q14. Then it goes out on the same connector (10) (pin 7 for processed audio) to the balanced modulator which is elsewhere on the IF board.

If you have a scope check to see if there is any drive to the compressor opamp (Q13) on pin1. If that is OK you can check the output of the opamp on pin 3 or the output of Q14 on either side of coupling cap C65 which couples the signal to the connector (10) which is on the board.

Hope this helps, static voltage checks are not very useful unless you have a chart from Kenwood telling you what you should see on the device.

Topic: 22806 Message: 22806

I've had ALC problems for a while that I've attributed to a bad 12BY7. I replaced the 12BY7, trying both "new" JAN GE tubes I received from Surplus of Nebraska and the problem still persists. Though plate voltage and current stay constant and I can get at least 100 watts out from 30m - 160m, the ALC is still weak with the CAR control maxed out and it sags down even in tune-up mode. Additionally, the higher up the bands I go towards 10m, the twitchier tuning gets; peak RF is nowhere near the plate dip and 100 watts is impossible to make. The ALC weakness seems to get worse when the rig is warmer and possibly more erratic. I had an inkling that the finals might be bad, but the symptoms don't quite add up in my tube virgin brain.

I thought I'd make sure connections look good and are clean before posting here which was likely a big mistake. I Re-tightened all the screws I could reach, removed the VCO coax plugged into the RF board and reinserted it. Now I don't know if I caused the problem or just exacerbated a marginal connection, but as I was plugging in the connector, I slipped and jammed my hemostat into the board. Now one of the leads for coil T3 on the RF board is severed and I have NO output at all.

I've been fixing small radios and building kits since I was a kid, but getting the RF board out, repairing or replacing the coil and getting it reassembled correctly might be to big of a bite to chew. Additionally, thought I'm decent with my soldering station, the coil wires are barely visible and probably on the edge of my skills.

My "bench" is simple but functional: An old HP frequency counter, O-scope, DMM, digital soldering station and a hardly stable signal generator. I'm waiting for my 1n34As to arrive to build an RF probe.

I bought the '830 because I always wanted one and I wanted to gain first hand experience operating and repairing tube output circuits. Aside from a quad EL34 guitar amplifier I've been nursing over the years, this rig is the first high voltage kit I'll be getting my hands into.

I'm mad at myself for wounding my favorite and ONLY rig at the moment; I'm off the air now. I'm stopping to take a breath and ask for advice before compulsively tearing a rig full of irreplaceable parts apart. I had considered sending it out to K4EAA for an alignment/tune-up before any of this happened , but I won't learn anything by taking that route. Instead, I decided to stock up my tool kit and get to it. Now, through a stupid slip up, I've managed to completely silence the rig 45 minutes after opening it up.

What are your suggestions? Are any of you in or around the Cincinnati area and interested in lending a hand? After a deep breath and a night to sleep on it, I can probably carefully disassemble the rig and fix the board, but it's going to take a good deal of time and some local guidance would be greatly appreciated. The urge to rush and get back on the air will be hard to resist. Failing that, are there any shops in the Cincinnati/Tri-State area you'd trust with a hybrid Kenwood?

Thanks,

Doug/KC8HQX

> I do not have access to an Elmer to help me with this so please bare with me. Should I remove Rectifier board and check components such as resistors, capacitors and diodes removed from board?. I tried reading resistors while they are still mounted on board but could not get a reading except for R9 100K Ohm that showed 640 Ohms. What really scares me is what is causeing Rectifier board to go bad if theese measurements are even slightly

accurate.

22809. Kenwood TS-830S MARS Question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-10 03:43:23 UTC
From: jonkd4mpw
Topic: 22809 Message: 22809

Hello friends. I am the proud new owner of a Kenwood TS-830S. I was wondering if this radio is able to transmit on MARS frequencies. If not, is there a modification available to make the radio to where it can transmit on MARS frequencies. Please let me know and yhank you.

Jonathan B. O'Rear

Thanks George,
Check has been mailed.
I will let you know what I find. I LOVE a challenge !!!
I don't know why my emails don't go through to you directly, but I apologize to the group for this small issue.
73 to all,
Gordon

22814. Re: [TS-520_820_530_830] Kenwood TS-830S MARS Question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-10 12:59:37 UTC
From: Calvin Rousseau
Topic: 22809 Message: 22814

I was a MARS member for a short time many years ago, I used a TS-520SE. In my experience, MARS selects frequencies that are just beyond the legal band "edges" for normal amateur operation. The TS-520 (having a 600kc bandwidth VFO), easily tuned far enough outside the normal ham frequencies to allow MARS operation without any modifications. I'm not sure if the 820/530/830 series will also do this with their synthesized frequency generation schemes. To check, tune your 830's receiver beyond the band edges, if it will tune far enough to receive the MARS frequencies, then these rigs will also transmit there. This ability to operate to a limited degree outside the amateur bands is simply a byproduct of the design and technology of the era in which these rigs were built. The "unlocking" of MARS/general coverage transmit capability didn't even become an issue until the advent of the solid state rigs withe their digital frequency generation schemes, and the ability of designers to incorporate transmit frequency limits. Historically, this coincided with the boom in CB radio popularity and the widespread illegal operation that plagues us all to this day.

Jonathan-

Lamps are readily available on www.k4eaa.com . Open the top cover and
you'll see that replacement is a piece of cake. Also, read K4EAA's site for
an explanation of the TS-830S Gold.

It should be fine, you need 4 (I think) and you will have to add the
appropriate resistor for 12V. Little more work but should last longer, be
brighter and look original. That being said, getting the lights from Ken
isn't a bad idea either, just thought I would give you a second option.

The 4 fixed crystal positions are not for "out of band operation". Each crystal position, depending on the position of the FUNCTION switch (VFO-R, FIX-R, or FIX), provides for frequency control as follows:

1. VFO-R - Receiver frequency is controlled by the VFO. Transmitter frequency is controlled by the crystal.

2. FIX-R - Receiver frequency is controlled by the crystal. Transmitter frequency is controlled by the crystal.

3. FIX - Both receive and transmit frequency is crystal controlled.

The crystal frequencies must be between 5.000Mhz and 5.500Mhz. The crystal(s), again depending on the position of the FUNCTION switch, simply replaces the VFO in receive, transmit, or both receive and transmit. See the 520 and 820 operators manual for details on how to calculate the crystal frequency.

Aloha Jonathan,
I emailed Ken and go a responce in less than a hour. Check your anti-spam. Also Radio Shack sells these bulbs I saw some yesterday(and the Hawaii stores dont have squat for parts) they are the incandesent not the Diode type.
Good Luck
Roland AH6RR

Are you asking if purchasing the VFO-240 will extend the operating frequency of the TS-830? If so then the answer is "No".

The VFO-240 operating frequency range is the same as the TS-830s internal VFO.

Hi Johnathon. The radio should transmit past the band edges. It uses an electrical/mechanical VFO (it is NOT PLL systhesized)The digital display merely displays the frequency. I believe that the radio should be able to be used on the MARS frequencies, as these are only a few Khz outside the U.S. Amateur Band limits.

I don't have the model number for the light bulbs that you are looking for, but any small 12V bulbs will work. Radio Shack sells a set of three 12V bulbs that are red, yellow, and green that will work. If you don't want colored bulbs, just wipe off the color with a bit of nail polish remover on a cloth or a cotton ball.

While these radios can be modified to operate on other frequencies, it is not recommended, and probably is not legal to transmit on most frequencies outside the U.S. Amateur bands with (The Mars frequencies are an exception if you are a Mars operator).

From: w5rkl
Topic: 22783 Message: 22825

The Radio Shack part number for the 12 volt mini lamps is:

272-1141

"Mini LAMP"

Price: $1.95 (one lamp)

If your local Radio Shack does not have them in stock then have the sales person order them for you. Radio Shack can have them shipped directly to your house. You pay up front first. I bought 10 of them and the lamps arrived within 5 days of the initial order. I installed them in my 820 (3 lamps) and none of the lamps have failed over the past 3 years.

http://www.radioshack.com/search/index.jsp?kwCatId=&kw=272-1141&origkw=272-1141&sr=1

The RS lamp leads are color coded RED and WHITE. The lamps are NOT polarity conscience nor does it matte whether the voltage is AC or DC. There is no requirement for a series resistor either. Simply cut the old lamps out and splice the RS lamps in place of the original burned out Kenwood lamps.

I actually had enough top make up 5 cables.
4 have been sold. I have just one left for the 520/820 VFO.
They are 30" long.
Please Email me off list if interested in this Last one.
The Cable is $25.00 plus $4.80 for priority mail shipping.
Thanks,
Gordon

Last Cable has been SOLD.
Thanks to all.
I may make more cables up in a couple of weeks if there is interest.

73,
Gordon

Thank you sir. Can you tell me what the external VFO is for? I notice that it is an optional accessory for the Kenwood TS-830S. Thank you again friend.

Subject: Re: [TS-520_820_530_830] Kenwood TS-830S MARS Question

Hi Johnathon. The radio should transmit past the band edges. It uses an electrical/mechanic al VFO (it is NOT PLL systhesized) The digital display merely displays the frequency. I believe that the radio should be able to be used on the MARS frequencies, as these are only a few Khz outside the U.S. Amateur Band limits.

I don't have the model number for the light bulbs that you are looking for, but any small 12V bulbs will work. Radio Shack sells a set of three 12V bulbs that are red, yellow, and green that will work. If you don't want colored bulbs, just wipe off the color with a bit of nail polish remover on a cloth or a cotton ball.

While these radios can be modified to operate on other frequencies, it is not recommended, and probably is not legal to transmit on most frequencies outside the U.S. Amateur bands with (The Mars frequencies are an exception if you are a Mars operator).

22831. Can The Kenwood TS-830S Transmit And Receive On MARS?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-11 03:54:40 UTC
From: jonkd4mpw
Topic: 22831 Message: 22831

Hello again friends. I asked earlier if the Kenwood TS-830S could transmit and receive on MARS. I got this following article from:

http://www.df1ud.de/Englisch/Oldtimer_e/Kenwood_TS-830_e/kenwood_ts-830_e.html

It states the following: The TS-830S VFO covers more than 50 kHz above and below each 500 kHz band. The optional VFO-230 external digital VFO covers about 100 kHz above and below each band, for MARS and other applications.

I think this also applies to the VFO 240 which can be seen by clicking this link:

http://images.google.com/imgres?imgurl=http://www.universal-radio.com/CATALOG/hamhf/vfo240.jpg&imgrefurl=http://www.universal-radio.com/CATALOG/hamhf/vfo240.html&usg=__j2KQaASFFUnmBQB0LIYV7ZBgUNU=&h=251&w=266&sz=30&hl=en&start=1&um=1&tbnid=OTRrBZkpSiKAOM:&tbnh=107&tbnw=113&prev=/images%3Fq%3Dkenwood%2Bvfo%2B240%26ndsp%3D20%26hl%3Den%26client%3Dfirefox-a%26rls%3Dorg.mozilla:en-US:official%26sa%3DN%26um%3D1

Please let me know if this is possible and thank you.

Just checked my TS830 on 20 meters. Internal VFO 13.937.9Mhz to 14.587.8Mhz. On the VFO-230 13.900Mhz to 14.599.9Mhz.
Hope this helps in your Quest.
Allan.

Hi Ken,
It is the Connecting Cable that goes between the radio and the external
VFO.
I have been making them for the 520/820 radios and also the 530/830 radios.
The Original ones are impossible to find, too short and too stiff.
Hope that explains it.
73,
Gordon

Thanks Ruben,
I am sure I'll find a nice home for it in another 830.
I appreciate your generosity.
Hope you are feeling better.
73,
Gordon

Hi Johnathon. The external VFO is usefull for a couple of things. Some DX stations work split frequencies. That is that they transmit and receive on different frequencies. With the external VFO, you can work these stations. It is also handy if you want to be able to quickly switch between two frequencies on the same band.

Many Hams never need or want an external VFO. The only thing that it is really needed for is to work split frequencies as mentioned above.

When I bought my TS520 on end of model close out discount, I was offered the VFO520 for just a few more dollars. Also they threw in a HyGain ten meter Yagi at reduced price..
I played around with the VFO to see if it worked but never really used it.
I finally sold it to another ham who saw it in my shack and wanted to work DX stations on 40 M SSB.
I still have the Yagi Up and work the band openings on ten M often.

22843. 6146B question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-11 18:56:08 UTC
From: corner5
Topic: 22843 Message: 22843

Hi,
I now own a TS-820S that I have not put on the air yet, and I have some beginner questions about the tubes. I will soon be attending a local hamfest and I thought I could look for a second set of "backup" tubes.
My questions:
> How important is it that the 6146B pair be "matched"? I have read conflicting opinions on this. I have read that if you neutralize them correctly, matching does not matter (providing they are both of the same manufacturer). I do know that matching seems to be justification for asking for more money.
> How available are these tubes? Should I be obtaining two sets of backups because I may not find them in the future?
> Should I also be looking at getting a backup or two of the 12BY7A?
> Lastly, is there any way to guess the condition/life of tubes just by looking at them? Darkening, etc.?
Thanks! 73, ac0z, paul

Not at all important. They're run in parallel. Neutralisation is
vitally important to getting the thing to work at all.

> > How available are these tubes? Should I be obtaining two sets of
> backups because I may not find them in the future?

I had no trouble getting NOS RCA 6146As, and they crop up all the time
on eBay. As far as I'm aware there are various Eastern European and
Chinese manufacturers still making them.

> > Should I also be looking at getting a backup or two of the 12BY7A?

Mine was perfectly okay but I changed it anyway just because I had a new
one. They don't live a particularly hard life, but it wouldn't hurt to
have a spare.

> > Lastly, is there any way to guess the condition/life of tubes just by
> looking at them? Darkening, etc.?

Not really, beyond loss of output. Obviously if the glass envelope is
damaged, it's for the bin. Gas leaking in makes them glow a pretty blue
colour.

Hi Ken,
It is the Connecting Cable that goes between the radio and the external
VFO.
I have been making them for the 520/820 radios and also the 530/830 radios.
The Original ones are impossible to find, too short and too stiff.
Hope that explains it.
73,
Gordon

Topic: 22843 Message: 22847

I think you will want to use 6146B in your kenwood.
 Matched pair is NOT needed.
there are a couple of files in the files page here on the
group page all about the 6146 family of beam tubes.
Click the link below and scroll down the page.

Hi,
I now own a TS-820S that I have not put on the air yet, and I have some
beginner questions about the tubes. I will soon be attending a local
hamfest and I thought I could look for a second set of "backup" tubes.
My questions:
> How important is it that the 6146B pair be "matched"? I have read
conflicting opinions on this. I have read that if you neutralize them
correctly, matching does not matter (providing they are both of the same
manufacturer) . I do know that matching seems to be justification for
asking for more money.
> How available are these tubes? Should I be obtaining two sets of
backups because I may not find them in the future?
> Should I also be looking at getting a backup or two of the 12BY7A?
> Lastly, is there any way to guess the condition/life of tubes just by
looking at them? Darkening, etc.?
Thanks! 73, ac0z, paul

From: n6wk@n6wk.com
Topic: 22651 Message: 22848

The connectors on the ends are the almost impossible to find 9 pin mini
tube Connectors like a 12BY7 tube that Kenwood used back then.

These are the same connectors that are used to plug into the back of the
Rig when no External VFO is present.

73,
Gordon

Topic: 22849 Message: 22850

Hello Todd,

It appears the LSB CAR UNIT crystal is not oscillating. This could be caused by a faulty/bad LSB CAR UNIT crystal or some other problem on the CAR UNIT board resulting in the LSB CAR UNIT crystal failing to oscillate.

If you do not have the 520's service manual, you can download it free from n6wk's website. The service manual for the TS-520S can be downloaded at the following link:

http://www.n6wk.com/kenwood/520S_Service.pdf

If you do not have the TS-520S operating manual then you can download free at the following link:

http://www.n6wk.com/kenwood/

If you technical and/or troubleshooting skills are lacking then may I recommend locating a local ham who has the skills that can help you troubleshoot and repair your 520. The 520 is not difficult to fix but it can, at times, be quit over whelming.

Hello Paul,

You can easily find 6146B tubes. The following link is one website that carries 6146B final tubes along with thousands of other tubes.

http://www.vacuumtubes.net/

Do not waste you money on matched tubes for your TS-520S.

Unless there is evidence the tubes are failing or weak, there is no need to replace them. Replacing them "just for the heck of it" or "the tubes are old and discolored around the silver coating inside the tubes glass envelope" is a huge waste of money. Discoloration of the silver lining on the inside of the glass envelope is not an indication the tube is going bad.

The "silver lining" (coating) on the inside of the glass envelope is the result of the "getter" process during manufacturing. Once the getter process takes place it cannot be repeated.

If the silver lining on the inside of the tube's glass envelope has turned "white" then that is a clear indication of a broken seal or crack in the glass envelope which results in a complete loss of vacuum. The silver lining turns white when exposed to air. You can't fix this so throw the tube away.

Here's a website that contains a lot of good tube information that will help you understand this and answer other questions you may have about tubes.

http://www.vacuumtubes.net/How_Vacuum_Tubes_Work.htm

22852. Help with Trio TS-820D

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-12 06:09:24 UTC
From: jorgensentech
Topic: 22852 Message: 22852

Hello,

My name is Erik, KD6RRR. Thank you very much to the moderators for approving my membership.

I am hoping to get the group members advice on what they feel would be a fair asking price for a Trio TS-820D I am hoping to pass on to a better home.

I see from the group instructions that I am not allowed to offer it for sale here on the group for at least one month, so I will be sure to only list it elsewhere.

The rig powers on, and with a simple loop antenna receives local transmissions fine on all bands. I do not have a proper antenna system to test the transmitter. All knobs and switches function smoothly except for four of the five toggle switches on the left side which are missing the toggle. The four switches can be operated with no problem, they are just missing the post that extends out beyond the face of the rig. All lights appear to be functional; I do not know exactly where all they are located to be sure. In the dark, it is easy to see what needs to be seen to operate the rig properly. The meter functions. The digital display appears to be installed, but does not illuminate. When powering the transceiver on, there is current being drawn at about .6A, and when the heater is switched on, current draw rises to 4.8A, so I assume it is functioning properly.

The rig was used as a monitor by a elderly Citizens Band enthusiast who retired years ago from the railroad and enjoyed listening to CW but never wanted to become licensed as an amateur. He took great care of the rig before it landed in my lap. I fear that things have taken a turn for the worse for me and I have sold all my amateur gear save for this one.

Thank you for your input and time in replying.

73,

Erik

22854. TS-520S and problem with 3SK40 - attempting replacement

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-12 12:51:13 UTC
From: luke_dft
Topic: 22854 Message: 22854

Hello Group,
I'm new here, and this is my first post to this group. Let me introduce myself. I'm ham radio operator from Poland, and proud owner of TS-520S accompanied by several pieces of it's line. Recently, this wonderful trx suddenly refused to transmit. After tracing a bit I found that problem is faulty 3SK40 mosfet (Q1 on RF unit). I know that this problem appeared several times on this group. Unfortunately replacements suggested by many people such as 3SK48, 3N211 or 40673 available on ebay seem to be expensive solution. I decided to use BF961 transistor in place of 3SK40. It's rather cheap, and being still manufactured easy obtainable. BF961 transistor fits in rf board socket without crossing it's leads. Now my TS-520S works great, and after two days of testing my signal reports are ok. I think that this hint can be helpful to people having similar problems.
VY 73!
Luke SQ8DFT

Yes, if you want to go into the limited space between the front panel and the VFO can. You can loosen a coupling in there are move the dial to line up.
I always left mine alone after looking into the details and seeing how little space there is to maneuver in there.

Yes, if you want to go into the limited space between the front panel and the VFO can. You can loosen a coupling in there are move the dial to line up.
I always left mine alone after looking into the details and seeing how little space there is to maneuver in there.

I believe the calibration procedure is to accurately set the digital dial isn't it? The mechanical dial is coupled to the VFO shaft. What ever you do, DO NOT play with the USB offset. That is set so you can flip from UBB to LSB and stay on the same frequency.

Greg

Don't worry about the dial, the dig. readout is what you want to go by.
The mech. dial will never be any closer the 1.2 KC anyway
Don.
Ex TKC tech.

Topic: 22856 Message: 22866

It is one of the adjustments thru the cover on the VFO can. Just don't touch any of them and you won't be in trouble.

Greg

I believe the calibration procedure is to accurately set the digital dial isn't it? The mechanical dial is coupled to the VFO shaft. What ever you do, DO NOT play with the USB offset. That is set so you can flip from UBB to LSB and stay on the same frequency.

Yes, if you want to go into the limited space between the front panel and the VFO can. You can loosen a coupling in there are move the dial to line up.
I always left mine alone after looking into the details and seeing how little space there is to maneuver in there.

Jonathan , some things are better left as is . I have 44 years as a ham and a decent test bench with good test equipment and I wouldn't make the adjustment or worry about it .

From your description , it does not sound like it is serious enough of a problem to be of concern .

Just my 2 cents worth .

Greg,
I'm an avid CW operator and before I tried to find CW filters for your TS-830, I would use the VBT, IF Shift, and notch filter until I decided it was not enough for you. I find these to be excellent CW tools and long ago gave up on the idea of a CW filter.

David-

The YK88C is in relatively good supply on eBay, QRZ and or QTH.com. The YG455C is rare for some reason and you'll be lucky to find one anywhere at any price.

However, don't despair, the YG455C-1 which is in very good supply, is nothing more than a YG455C mounted on a carrier board with connectors. Buy one of these and unsolder the filter from the carrier and you're ready to mount it in your TS-830S.

I just installed both of these filters in my TS-830S yesterday and it was a royal PIA. You can only tilt the IF board so far and you wind up needing three hands. I didn't want to disconnect the board for this installation because the connectors seem to be fragile and I didn't want to screw up the board..

Good luck,

-Dick-

I purchase a like new Kenwood Ts 830s and it doesn't have cw filters.

How do I find YK88C and YG455C cw filters ?

What CW filters are compatible with the TS-520S ? I know about the INRAD... are there any others? Maybe something "in good supply" or that I can remove from a "carrier board" as N3XRU describes for the 830S ? I just want to know what to look for on e-bay...

David-

The YK88C is in relatively good supply on eBay, QRZ and or QTH.com. The YG455C is rare for some reason and you'll be lucky to find one anywhere at any price.

However, don't despair, the YG455C-1 which is in very good supply, is nothing more than a YG455C mounted on a carrier board with connectors. Buy one of these and unsolder the filter from the carrier and you're ready to mount it in your TS-830S.

I just installed both of these filters in my TS-830S yesterday and it was a royal PIA. You can only tilt the IF board so far and you wind up needing three hands. I didn't want to disconnect the board for this installation because the connectors seem to be fragile and I didn't want to screw up the board..

Good luck,

-Dick-

Subject: [TS-520_820_530_830] Could use some help

I purchase a like new Kenwood Ts 830s and it doesn't have cw filters.

How do I find YK88C and YG455C cw filters ?

Jonathan , some things are better left as is . I have 44 years as a ham and a decent test bench with good test equipment and I wouldn't make the adjustment or worry about it .

From your description , it does not sound like it is serious enough of a problem to be of concern .

Just my 2 cents worth .

Jonathan,
You can adjust the mechanical VFO scale to the digital.
The VFO knob has a second knurled ring on the back of the big VFO knob that can be turned separately and is connected to the mechanical VFO scale. You just keep the big VFO knob locked with one hand and turn the knurled knob until the mechanical scala correspondents with the digital display of the VFO. It is really a cosmetic thing, because the digital counter is the one that is to use really.
See page 21 of the Operator manual.

Hope this helps,
73, Wim PA0PGA

Are there two rings present on the main tuning knob? I tried that but the manual dial would still turn. I could not get it to stop turning to line up with the digital read out. Is there a way to lock the knob or ring(s) from turning? Please let me know and thank you again.

Hello kevin. You can probably purchase them from k4eaa.com but email him to check his supply first. Jonathan KD4MPW

Hi Kevin,
The bulbs 12V 25ma
Radio Shack part number 272-1141 works.
Also Ken k4eaa has some that might last longer.

Whoa!!!! That kind of answer isn't productive at all.
I think I understand what the asker is talking about. Say for example the Digital display shows 14.200.0 but the Dial does not exactly line up with the 200 on the round dial.
Adjusting the outer ring on the main tuning knob will NOT make these two coincide. There are two ways to make these line up.
well, actually three ways.
First, how much of a difference is there between the two?
Second of all, does the VFO to Dial variation stay linear from 0 to 500 on the Dial scale as compared to the digital display?
If it does or is very close, then they can be adjusted by removing the front Knob, loosen the nut (12mm I think) and carefully move the dial to match the Digital display.
The hard part is holding the dial in the correct spot while tightening the nut back up.

And I am stunned at the way you are talking to us. I am completely new to this and will take all of the advice from seasoned hams I can get as they have the best advice. If you don't like their answers don't read the response. This group is for informational purposes and friends in my opinion. I have read the manual and it is greek to me as a beginner but I am learning a lot by asking questions to seasoned veterans.

830 s calibration / pleae see picture

Whoa!!!! That kind of answer isn't productive at all.
I think I understand what the asker is talking about. Say for example
the Digital display shows 14.200.0 but the Dial does not exactly line up
with the 200 on the round dial.
Adjusting the outer ring on the main tuning knob will NOT make these two
coincide. There are two ways to make these line up.
well, actually three ways.
First, how much of a difference is there between the two?
Second of all, does the VFO to Dial variation stay linear from 0 to 500
on the Dial scale as compared to the digital display?
If it does or is very close, then they can be adjusted by removing the
front Knob, loosen the nut (12mm I think) and carefully move the dial to
match the Digital display.
The hard part is holding the dial in the correct spot while tightening
the nut back up.

Kevin,

The lamps are on the lower right portion of the 520 schematic. They are labeled "PL1" thru "PL4". "PL" stands for "Pilot Lamp".

Thomas.... I understand your frustration at what you see as "dumb questions" from guys who haven't bothered to read the manual, but reflectors such as this are not just for the knowledgeable and experienced, but also for those who need help at many levels. And it's for those with the patience to answer questions and provide that help. It sometimes requires a lot of patience, which you clearly don't have much of at the moment. A good memory is also helpful, to recall when you yourself didn't know much and needed some assistance.

Kevin,

The lamps are on the lower right portion of the 520 schematic. They are labeled "PL1" thru "PL4". "PL" stands for "Pilot Lamp".

Some of the nit-picky people with digital dial numbers out to the tenth of a HZ drive me nutz!
They have to have the freq set right to 14.2000000000 even if nobody else in the net is quite there !?!?!
Back when I started we thought it was great if your receiver had a mechanical dial mark every 10 KHz !
Only the high end ones had a Xtal Calibrator .
The xtal in your transmitter may be pulled off freq by your osc circuit so if it was within a few KHz of its marked freq you never knew it !
Only care was to avoid band edges.
We still had fun.

It is sad to see a person , that hurts the entire group .

We ALL were not inherently born knowing everything there is to know about radio , and even reading the books thoroughly at times , still leave you saying what are they talking about .

It can be for any number of reasons . If you are new , sometimes it is better explained by someone with experience , than trying to figure out what the manual is saying . I was a Novice 44 years ago and you know what , I still ask questions today , if it is not clear to me .

I can give you a valid medical excuse in my case , being disabled , with a neuro muscular disease , that DOES have an effect on my memory , as does the medication that I take for the condition .

Does that mean that I need to go back and read a book that I have read cover to cover many times in 30 or more years ?

I used to be the local guy that serviced most any brand of rig for the local guys , even homebrew equipment , free of charge . Now I find myself needing help at times .

This is the most helpful list for a particular group of radios that I have EVER belonged to .

I really don't know anyone on this list , and have no problems with my reliable old plain jane 520 , however I thoroughly enjoy reading the posts from the experts that know these rigs both inside and out . Mike absolutely amazes me . Reminds me of myself in my younger days . Gordon and so many others that I only know their names from their posts can usually put you right down to the exact component , without ever even seeing your radio !!

THANK YOU to ALL of you that I can't remember the names of for the posts . I REALLY enjoy just reading the problems and solutions .

Being on a fixed income , I may one day need their services and I will not hesitate to ask . Sending a radio out for repair isn't in the limited budget . They are the TRUE hams that helped me when I first started this wonderful hobby .

I have my eyes on a TS-830S , in absolutely new looking condition , with remote VFO and AT-230 tuner and matching speaker . It is not being used , because the gentleman could never figure out how to load it up due to his age and lack of understanding . If by some miracle , I can come up with the funds , I am going to buy it and it will be like buying a brand new state of the art radio. I do miss having 160 meters .

THANKS TO ALL OF THE WONDERFUL GUYS ON THIS LIST HELPING each other !!

There are no stupid questions , only stupid answers !!

Any of you try one of the MFJ-290K's on a 520? If so, did it work
well? This is the mic in question:
http://www.mfjenterprises.com/Product.php?productid=MFJ-290K

I asked MFJ but got a very cryptic and less than informative answer.

Gordon,

That sounds pretty FINAL, Gordon ... maybe "he's no longer part of this group" is a tad more palatable. :)

Just a note of thanks to you and everyone else on this group. Although I am a big Kenwood fan (see below), I haven't made too many posts over the years. And, although I don't read every post, I have found lots of useful tidbits in many of the posts.

I have both manuals for all my rigs and have indeed read them many times - but sometimes some useful hint/kink comes up that just isn't in them. So I am grateful for that.

Keep up the very good work and 73 to all!

Cheers!

Robert

All,

I hope this message is legal and does not offend anyone....

I have never met or had a QSO with W5COV, but after reading Charlie's last post (See below), it sounded warm and from the heart....and I for one would be honored to be part of making Charlie's dream rig be his.....

I will contribute $200 to the cause of getting this 830 & accessories in good hands....I have one myself and think Charlie is deserving.

How about it gang?

How much do we need to raise Charlie?

Warmest regards,

Dave

I used to be the local guy that serviced most any brand of rig for the local guys , even homebrew equipment , free of charge . Now I find myself needing help at times .

This is the most helpful list for a particular group of radios that I have EVER belonged to .

I really don't know anyone on this list , and have no problems with my reliable old plain jane 520 , however I thoroughly enjoy reading the posts from the experts that know these rigs both inside and out . Mike absolutely amazes me . Reminds me of myself in my younger days . Gordon and so many others that I only know their names from their posts can usually put you right down to the exact component , without ever even seeing your radio !!

THANK YOU to ALL of you that I can't remember the names of for the posts . I REALLY enjoy just reading the problems and solutions .

Being on a fixed income , I may one day need their services and I will not hesitate to ask . Sending a radio out for repair isn't in the limited budget . They are the TRUE hams that helped me when I first started this wonderful hobby .

I have my eyes on a TS-830S , in absolutely new looking condition , with remote VFO and AT-230 tuner and matching speaker . It is not being used , because the gentleman could never figure out how to load it up due to his age and lack of understanding . If by some miracle , I can come up with the funds , I am going to buy it and it will be like buying a brand new state of the art radio. I do miss having 160 meters .

THANKS TO ALL OF THE WONDERFUL GUYS ON THIS LIST HELPING each other !!

There are no stupid questions , only stupid answers !!

Charlie , W5COV

Dave ,

God Bless You . This is certainly an amazing group of hams and people that care about their fellow man .

Your gesture was a complete unexpected shock to me for which I am sincerely grateful .

I am trying to make a deal with him at the present time , that I can handle . He is a kind and generous ham too and he and I can probably make arrangements for me to work out a deal with him , that will allow me to make payments to him that I can afford .

He has not set a firm price on it yet . He just knows that at his age he can not use it and doesn't want to put any finals in it , that he will just lose again , without ever getting it on the air .

Again , I can not express my gratitude enough for your offer . Should I get it , I am for sure going to be looking for finals for it . At that time I will be looking for cheap to get it on the air .

For the time being , let me see what he and I can work out .

THANK YOU SO MUCH !!

Charlie , W5COV

Thanks for running a great group Gordon. I don't contribute a lot to the group because there are others here that are so much more knowledgeable about the Kenwood Hybrids than I am. I do however like to read the posts and they add a lot to my enjoyment of my hobby. I've had quite a bit of work to do to my 520SE and the site's been a great help. Everything may be in the manuals but to be able to talk things through with someone can be an invaluable aid to understanding a problem.

Keep up the good work.

Hi Tom. I have not tried the mic in question, but I note that the impedance of the mic is not given. The TS-520 requires a high impedance mic. There is no way to tell how the mic will sound except to try it. Personally, I would be more likely to look for the appropriate Kenwood mic for the radio, but thats just me.

Good Luck.

22905. Re: Mic

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-14 14:43:32 UTC
From: w5rkl
Topic: 734 Message: 22905

While looking for information on the MJJ-290 microphone I came across the MFJ-9406 6 meter transceiver manual. On page 2 of the MFJ-9406 manual, it states the audio impedance of the MFJ-9406 transceiver is "600 ohms". On page 3 there is a brief statement concerning microphones. It says the following:

"The MFJ-290 dynamic mobile microphone complements your radio's speech processor."

Does that mean the MFJ-290 microphone is a low impedance microphone? Maybe, maybe not. From what I understand it is low impedance. I could be wrong so don't hold me to it.

Here's the link to the MFJ-9406 manual that briefly talks about the MFJ-290 microphone:

http://www.gokarters.com/vbforum/attachment.php?attachmentid=702&d=1217974795

It's a PDF file.

I also agree, try it first to see how it works. Have fun.

Sounds like it's a low impedance microphone, not suitable for any hi-impedance Kenwood.

Chris,

I could be wrong but I believe the TS-830M was not sold in the U.S. Therefore, if that's true then I would suspect the "M" model may have had its own serial numbers. Again, I could be wrong.

I can't say whether the serial number can tell you when the radio was manufactured.

The TS-830M was never marketed in the U. S. Kenwood had some weird way of imbedding the month and year of manufacture within the serial number. If they followed true to form with this rig, it was manufactured in 1979, the month of August, and it was the 840th made. The key is to know the years of production.

Thanks all for the replies. Sounds like it's a no go on the mic
according to you all. For clarity, this is the question I asked MFJ:

> Looking at the MFJ-290. Would that be a suitable replacement mic for a
> Kenwood TS-520SE that calls for a 50K ohm mic? Also, would it be a
> good replacement for a worn mic on a Yaesu Ft-101 (early)? Thanks for
> your time and 73.
>
> Tom
> KC9ECI

and this is the answer I got:

> sure, it will replace any microphone, but only gives speaker and ptt
> functions only. no up/down frequencies, VFO, Call, etc.
>
> mfj-290K, $19.95. 8 pin round microphone for kenwood rigs.
>
> mfj-290y, $19.95. 8 pin round microphone for yaesu rigs.

<snip>

A not atypical response ;-)

It would work at a pinch, with audio gain all the way up and speaking very loudly. You could make a preamp to boost up the level and let the radio see the high impedance it wants, or you could find a suitable microphone transformer.

Or - and this is my preferred option - you could save your money and buy one you know is going to work.

Subject: [TS-520_820_530_830] An 830 for W5COV

All,

I hope this message is legal and does not offend anyone....

I have never met or had a QSO with W5COV, but after reading Charlie's last post (See below), it sounded warm and from the heart....and I for one would be honored to be part of making Charlie's dream rig be his.....

I will contribute $200 to the cause of getting this 830 & accessories in good hands....I have one myself and think Charlie is deserving.

How about it gang?

How much do we need to raise Charlie?

Warmest regards,

Dave

==========
It is sad to see a person , that hurts the entire group .

We ALL were not inherently born knowing everything there is to know about radio , and even reading the books thoroughly at times , still leave you saying what are they talking about .

It can be for any number of reasons . If you are new , sometimes it is better explained by someone with experience , than trying to figure out what the manual is saying . I was a Novice 44 years ago and you know what , I still ask questions today , if it is not clear to me .

I can give you a valid medical excuse in my case , being disabled , with a neuro muscular disease , that DOES have an effect on my memory , as does the medication that I take for the condition .

Does that mean that I need to go back and read a book that I have read cover to cover many times in 30 or more years ?

I used to be the local guy that serviced most any brand of rig for the local guys , even homebrew equipment , free of charge . Now I find myself needing help at times .

This is the most helpful list for a particular group of radios that I have EVER belonged to .

I really don't know anyone on this list , and have no problems with my reliable old plain jane 520 , however I thoroughly enjoy reading the posts from the experts that know these rigs both inside and out . Mike absolutely amazes me . Reminds me of myself in my younger days . Gordon and so many others that I only know their names from their posts can usually put you right down to the exact component , without ever even seeing your radio !!

THANK YOU to ALL of you that I can't remember the names of for the posts . I REALLY enjoy just reading the problems and solutions .

Being on a fixed income , I may one day need their services and I will not hesitate to ask . Sending a radio out for repair isn't in the limited budget . They are the TRUE hams that helped me when I first started this wonderful hobby .

I have my eyes on a TS-830S , in absolutely new looking condition , with remote VFO and AT-230 tuner and matching speaker . It is not being used , because the gentleman could never figure out how to load it up due to his age and lack of understanding . If by some miracle , I can come up with the funds , I am going to buy it and it will be like buying a brand new state of the art radio. I do miss having 160 meters .

THANKS TO ALL OF THE WONDERFUL GUYS ON THIS LIST HELPING each other !!

There are no stupid questions , only stupid answers !!

I just received a New shipment of the RARE 9 pin Male connectors. I am going to start making up cables. I bought enough Connectors to make up 20, 520/820 VFO cables, 5 have already been pre-ordered and spoken for. I will be starting to ship on Friday. Don't miss out as I am not sure I can even get any more of these Rare 9 pin connectors.
The price is $25.00 plus $4.80 for Priority mail Shipping for each Cable. I combine shipping if you order more then one cable.
I will try to get more of these connectors and wire them up as the impossible to find Shorting plugs for these rigs.
Please email me OFF-List if you are interested.

73,
Gordon

I've got one of the old D-104 chicken chokers but while I used the heck out of one like in on CB back in the late 70's early 80's, I just can't quite get it adjusted to a point that I like without a squeal on the transmitted audio.

Hi Tom. The D-104 should not squeal! It may need to be rewired inside the base to work properly on the 4 pin Kenwood radios. They require that the PTT circuit be totally separate from the audio shield. You may have to change the wiring inside the base of the mic. It is OK for the mic wire to be connected all the time. In fact, it has to be if you ever would want to use VOX (I do not recommend using VOX at all).The PTT switch in the mic has to connect pins 2 and 3 on the mic plug, without either of these wires being connected to the audio shield.

The D-104 mics were made for CB radios, and they needed to be wired differently.

Another issue with the amplified D-104 mics is that you need a quiet room to use them. I have found that even with the gain control on the mic almost shut off, they pick up thew slightest noise in the room. While the D-104 will work if wired correctly, I would recommend selling it, and getting a more suitable mic. I would recommend a Kenwood MC-35S hand mic, or an MC-50 desk mic. Pretty much any high impedance desk or hand mic should work though.

22930. TS 520 Wire Wrap Pins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-15 04:19:10 UTC
From: RipV
Topic: 22930 Message: 22930

I recently picked up a eBay TS-520 "Technician Special"

Initially no transmit and not much receive either. After a bath of contact cleaner and some basic adjustments I get RF out but receive still seems low. I also do not have any WWV. Marker works but S meter does not ever indicate a signal. I zeroed the meter and played with S meter gain adjust to no avail.

OK, here is my question. Are there any chronic problems with the wire wrap connections? Other that a wire fall off are they known for bad connections or corrosion problems?

I am getting ready to dig in and start signal tracing and I don't want to waste time looking for hidden non problems.

Thank you in advance.

22933. Re: [TS-520_820_530_830] TS 520 Wire Wrap Pins

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-15 13:08:12 UTC
From: Jim Stanicek
Topic: 22930 Message: 22933

In general, wire wrap connections are as good as, or perhaps even better than solder connections ! Bell labs (Western Electric) used wire wrap on all their office equipment, and a lot of that stuff was replaced many years later, in perfect functioning order!

We used to use a "pull test" on the connections to see if they were secure, or not. This consisted of a spring loaded device that had a small claw that you hooked behind the coil of wire. If you could pull so many ounces without the coil slipping, it was considered to be a good connection, that would probably last the life of the device.

Any connection that slipped, was repaired by soldering over the coil. But unless your radio has badly formed coils (appear to be loose, overlapping coils, etc.) I wouldn't worry about them as such!

That was the Western Electric way, and Kenwood might have done it differently. But read the paragraph above.

Hope this answers your question.

From: Greg Anders
Topic: 22935 Message: 22936

1. Don't fully load the finals to max power. Leave the load at minimum and just dip the plate (with fully peaked drive).

2. See what your get for power in CW position. If you need to reduce it more you can certainly de-tune the drive/preselector slightly. However, be aware you are also desensitizing your receiver when you do this because the transmitter drive tuning and receiver coils in the front-end are ganged together and tuned in tandem.

3. If you have a linear that needs lower drive you will have to consider lowering the screen voltage on the Kenwood 6146's OR go into the rig and detune/unpeak a coil in the transmit mixer or driver circuit coils. But either of these solutions would dicatate that you would never be able to get 100W from the radio in cases where you want to run barefoot.

You should never de-tune the exciter to drive an amplifier. Use a 3db or
6 db resistive pad if the amplifier does not require much drive.

Thanks for the response Jim.

I figured that was the case. I used to Work for Honeywell in the Commercial aircraft division. We had a lot of wire wrap in several Flight computers over the years and the only problems we had was from boxes exposed to the sloppy waste handlers drippings. We did see a bit of broken wires but pretty much that was all.

I was asking the question as I had heard from several sources saying that the wire wrap was the root of all evil that lurks inside. I just wanted some real users opinions as I think these sources are want to be techs.

Thanks again.

From: Greg Anders
Topic: 22930 Message: 22941

Long long ago Western Electric did a study on the types of connections used for wires in communication equipment. The conclusion was this: a properly installed 6 turn wire wrap connection was superior to a three turn hand wired connection that also was soldered. For longevity Western Electric used mostly wire wrap in the telephone equipment they manufactured for the Bell system. Their Quality standard was set up by the famous Mr. Demming (who built Japan's manufacturing back up in post-WWII era). Mr. Demming had WE setting targets of 40 yr life expectancy for telephone gear.

FYI,

Greg

You could also do the ALC bias trick to reduce the power. I did it to
get 10W out when I had my MM3 callsign, and it worked really rather
well.

Hi Gordon,

I agree, that would work too. I kinda dislike the screen grid trick because 6146’s are designed to be most-linear with full screen voltage. Reducing it a sizeable amount can introduce
Increases in IMD and the like.

Some one suggested a 3 or 6db pad. However, since this is a transceiver you would have to put it in line only for the transmitter or you would lose receive signal strength as well.

Another way would be to go in an detune or un-peak a transformer that is located in the transmit signal path only. Somewhere like on the output of a transmit only mixer. That would in effect reduce drive to the finals.

Greg

On my TS520 , on CW you can back of f the Carrier knob for low power output. This is useless on SSB mode.
. The Drive control is a tuning capacitor that is ganged to the reciever front end tuning also, it has to stay at the peak setting.
If you detune the loading capacitor the plate tuning is affected and has to get re-dipped for min plate current.
I have run QRP down to half watt by backing down the carrier knob and worked 700 miles on 40M with 0.75 watts

What exactly is in sad condition on each of them ?

It is nice to have a parts rig , but my concern would be that taking say a board out of the parts 520 , in unknown condition and putting it in the "good" 520 , could damage other things in the "good" 520 , if there is a fault on the parts unit board .

I would install the tubes and then check to see if the Maximum RF output matches the plate current DIP. If it does, no problem. If it does not, swap the tube positions and check it again. I recommend doing the checking on 28.800 though.

One of the best tips that I've picked up from the site is to loosen and then retighten all of the circuit board mounting screws otherwise you can spend hours chasing strange faults.

D-104s are crystal microphones of extremely high impedance. (Rochelle salt crystals)

"The D-104 mics were made for CB radios, and they needed to be wired
> differently."

D-104s were invented in the 1930s for amateur transmitters, well before the birth of CB radios.

22960. Re: [TS-520_820_530_830] Neutralize tubes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-16 23:11:40 UTC
From: John Davidson
Topic: 22949 Message: 22960

The tubes are connected in parallel so there should be no diff what socket what tube goes into. Should not need any adjustment for neutralization if everything is the same (no different tubes used).

I have a 520 that was sent to me with the tubes removed. Since it worked well before I assume that it had been neutralized. The tubes were packed separately so I do not know which of the power tubes went into which socket. I have a 50/50 chance here. Do I need to neutralize?

I'm not talking about the screen grid trick, although that does work.
No, the ALC trick is described here:

http://www.radiomods.co.nz/kenwood/kenwoodts520.html

about 3/4 of the way down the page under the title "Kenwood TS-520S for
QRP". It would probably work well for reducing the output power to
drive a transverter, too.

Hi John. I was speaking of the amplified D-104 mics made in the 70s and 80s. Some of them need to be rewired to separate the mic shield from the PTT circuit to work properly on the 4 pin Kenwood radios. I think it depends on the exact base. Myself I prefer to use un-amplified mics for Amateur Radios.

I didn't know that D-104 mics were made that long ago, although I knew that Astatic mics had been around before CB radio. Most CB radio mics were wired to work differently (as far as PTT is concerned) than Amateur Radios. I don't know about nwere CB radios, as I got away from CB radio a few years after some brands switched from 4 pin to 5 pin mic plugs and wiring.

BTW, I enjoyed CB radio until too many jerks (in the local area) basically ran all of the folks that I talked to off the radio. The people I talked to just got tired of not being able to have a decent conversation without the jerks butting in all the time with stupid or malicious remarks etc...

In a way its a shame. I probably would have gotten my Amateur Radio license anyway, but I guess the situation motivated me to get it sooner.

We have a lovely situation right now where one of the local worthies thinks that anyone who got their licence this century shouldn't be allowed on the air. To that end he keys up over anyone he doesn't know or like the sound of, mostly on 2m (and at that, mostly on the local repeater). What has become particularly irritating is that he's discovered he can do it on 14MHz knocking off the MM3s who are getting into PSK31, and he's started annoying the bucketmouths on 27MHz who of course pop up and cause trouble on the repeater!

People will be (untranslatable Gaelic word) no matter where they are if they have relative anonymity. It's unfortunate that people who should know better do it, but there you are. Some people are just dicks.

I liked CB better when it was still illegal. The old UK channels are going to be going away and replaced by "community broadcasting" on 27MHz similar to what they have in Australia. I wonder what the bucketmouths will do then, when they discover that Ofcom take people stepping on their paying customers very seriously...

Sounds like time for a "fox hunt" to ID his location and inform whoever manages your amateur priviledges there. Maybe he needs a visit from your FCC type licensing personnel. Audio recording of interference and date/times may help them take action.

Oh, he's well known both to the amateur community and to Ofcom. They're just not terribly inclined to do anything about it. I expect that will change when he starts dicking about on 70cm when that gets "borrowed" for the 2012 Olympics...

Either that or once his location is found "Stick a pin in his coax" Ten fer over and out. Im gald we dont have any of them types here. And my Kenwood's are low inpedance. By the way Heil makes a great conversion kit for the D104 that has a HC-5 element and they soung fantastic.

I remember a guy back in the early 80s who used to have his CB aerial on his car, and just throw the coax in through the house window and take the CB inside with him. It worked pretty well, despite the aerial being pretty low (his house was quite high on a hill). Really well, in fact, until one day his wife called him in from the garden to quickly pop down to the corner shop (about ten miles away ;-)) for some milk...

Well I can understand why people think the of the D104 as a CB microphone. The Golden Eagle and all of the other products that Astatic came out with in later years were aimed at the CB market.

Hi all...

I am trying too remove the metal face behine the face plate on a TS-520. Pulling all the nuts off the knobs and screws from the face was the easy part but what about the switches ?? Is there any easy way to get them off the face with out un-soldering them all ??? Other then the Mic plug that usually has to be taken off and it kinda a pain but oh well..

Thanks
Dan

I think from memory that Astatic aimed the Silver/Golden/Night Eagle D104 product primarily at the CB market when there were the large CB Base Stations Available. Like for instance the Browning and Lafayette's etc; The Silver/Golden/Night etc; did have the TUG8 base which included a preamp of a sorts and it does improve audio qualitys of the Mike however, this was mainly used for impedance match as we have now discovered the Standard Mike Head is High impedance (50K) or there abouts and the input to CB radios of the day was 600R hence the small circuit in the TUG8 base.
Earlier versions of the D104 were however aimed at not only the Amateur Market but also the Commercial Two Way radio market at the Time; (Astatic have been around for a while!) when a Base Station commercial radio took up half a Desk top or half a room Many circuits have been published and many articles written on how to improve it's performance, but really why bother we've only got 1.8khz worth of bandwidth on a SSB transmission and the Mike works fine for what it was designed for . I own a D104 with TUG8 base which looks great in front of my KWM2A line up, I have left it as standard, why change it apart from a resistor L network to increase impedance to back high as the Collins is high input. They are an old mike, which for nostalgia purposes look great in front of older gear. There are better things available these days but there's something about using the "Lollipop" which makes operating even more pleasurable.

Cheers,
Frank VK5KV..

Topic: 22959 Message: 22978

There was one particularly annoying CBer who found his antenna and coax chopped into one inch hunks and laying in his yard. He was suspected of throwing carriers and , pinning coaxes as well as being an extreme ass on the air. While I cannot condone what was done to his antenna and coax, I have to admit that he did deserve it.

Although I have no transmit capability on 11M anymore, I do listen there occasionally. At the present time, there is very little activity on 11M in this area except for truck drivers passing through on the highways. Not that I plan to ever transmit on those frequencies again.

As I stated in another message, my remarks about the amplified D-104 mics were concerning those that were intended for use on CB radios. Those seem to need the mod mentioned in another message to sound good. Otherwise, I have found that the above mentioned amplified D-104 mics roll off the base frequencies, and somewhat accentuate the high frequencies. Therefore, people with high pitched voices tended not to sound good using those D-104 mics. People with low pitched voices tended to sound ok.

Having wired a D-104 (with TUG8 amplified stand) for a friend, and tried it on his TS-180S, my TS-530S, TS-120SE, and TS-430S, I can honestly say that I like the sound of the MC-50 and even the Kenwood MC-30S, and MC-42S hand mics better. Others (who helped with on-air comparisons) agree, and several asked me (without any hints at all) if I was using a D-104. However, to each his own. Those who like the D-104 mics are welcome to use them. I prefer mics that make the person using them sound as natural as possible.

Hello Dan,

Do you have the TS-520 service manual? If not then I recommend downloading it from Gordon's (N6WK) website.

http://www.n6wk.com/kenwood/

Front panel removal is shown on page 35.

Front sub panel disassembly is shown on page 36.

Rear panel disassembly is shown on page 37.

Individual switch removal is shown on page 40.

73's
Mike W5RKL

To get the WARC bands on the 830S do the following.
In early TS-830's, the WARC transmit was not enabled. Solder a jumper wire from Pin 12 of IC-23 to ground on the DIGITAL UNIT PCB. Ground can be obtained at Pin 8 of IC-4.
This is from the TS-830S Survival Guide.

Pin # 4 on Connector # 6 on the AF board It is labeled as "TOF" terminal.

Hope this helps.

Art,
It is explained on Page 27 of the Operating manual as well.

22986. Re: [TS-520_820_530_830] Re: Driver Tubes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-18 18:55:56 UTC
From: Jerry Keller
Topic: 22951 Message: 22986

I'm just trying to put together a list of driver tubes that will work, so I can keep an eye out at hamfests, on e-bay, etc. Looking through the spec sheets, the 8077 /7054 pentode seems to share nearly all characteristics with the 12BY7 / 12BV7 / 12DQ7 and I have been told that they are interchangeable. However, before I rely on it, I would rather confirm that interchangeability by hearing it here on the reflector from someone who has actually done it.

This inquiry was begun because my recently acquired TS-520S loads up fine up to and including 20M, but I get only a little indication of drive on 15M and none at all on any of the 10M band segments. This is with a 12BY7A driver tube. I tried several other 12BY7s with similar results, but I can't be sure how good any of these tubes are, so I'm looking for a few new ones to try.

73, Jerry K3BZ

Topic: 22982 Message: 22987

Gordon,

Thank you for the link which like you say explains everything on page 27. I opened my instruction manual for the TS-830S and page 28 matched the manual at the link below except the area below adjustment of monitor level is BLANK. No wonder I could not find it. Also under adjustment of receive if coils it is a little different procedure.

Gordon thanks for the help.

73,
Art
WB4MNK

PS Thanks for the reply Roland.

22988. D-104 nostalgza

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-18 20:25:33 UTC
From: Rich Jones
Topic: 22988 Message: 22988

Your CB heritage will only be evident if you refer to the D-104 as a Chicken Choker. I have used one on Drake and Ten Tec gear for a long time. If you put a resister in line with the green audio wire (Play with resisters to get sound you like) you can get the bass to improve and really improve the sound. I have a Heath Risister sub-box that is great for this. You can't harm anything but you may get the sound you like. I have old 1930 QST's magazine and the microphone is advertised in them and doesn't look any different than they do today. People use to make little knited "cozy's" for the head with your call letter on them> What a way to bring back memories. 73 Rich K8UV

Topic: 22988 Message: 22989

I ran a D-104 on my Heathkit SB-102 back in the early/mid '70's. We always referred to them a 'lollipop' mic. I even painted the head with a red and white spiral. Got a few comments over that! Heh.

If memory serves me, I added some resistance to the audio wire to give my audio a little more bass, as I have to live with a tenor voice...great for singing, but cruddy for Ham radio!

Happy here with the quality (and service) re the TS-830 as
well as the TS-520/820 VFO Cables from Gordon, N6WK.
Just a satisified customer.

I found in the files area what wire to cut to enable the WARC bands in the TS-520 but can not find the procedure for the TS-830S. Anyone have the procedure (what wire to cut) to enable the WARC bands in the TS-830S ?

22993. Good Scan of TS-830S IF Board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-19 17:02:06 UTC
From: ah6rr1
Topic: 22993 Message: 22993

Does anyone have a good scan of the IF board on the 830 the ones I have downloaded are so fuzzy you can not read where the component are located. I have a 830 that has no RX and after I finnish that I will get to the TX side it does not work either.
Thanks
Roland AH6RR

Does anyone have a good scan of the IF board on the 830 the ones I have
downloaded are so fuzzy you can not read where the component are located. I
have a 830 that has no RX and after I finnish that I will get to the TX side
it does not work either.
Thanks
Roland AH6RR

Hello Roland,

Have you checked all of the voltages on the Rectifier Unit, especially the "14A" supply?

Is the digital display working? Based on the information you have provided I suspect the digital display is not working.

Hi Roland,
You can grab it from here
http://www.n6wk.com/kenwood/TS-830-IF-Board%20Hi%20Resolution.pdf

It is about 1 Meg in size and is clearly readable

73,
Gordon

Here's what I have. I have 2 830's one has no TX and one has no RX I switched the IF board's the good RX into the bad RX after I determined that it was not getting a signal even with the Marker now that one has RX and TX so that goes back to the owner after a complete alignment. Now I will go over the IF board and see where the signal stops. Does anyone know what the replacements are for the 2SK125 and the 3SK75? In case it is one of them. After I get the RX then I will dig into the TX. Both radios have the read out working just fine.

Is this a typo?
"I found in the files area what wire to cut to enable the WARC bands in the TS-520 " I think you ment the TS-530.....
If not send me the link i sure would love my ts-520 to have WARC.

For all 3 bands: Break the line between the RF unit 44-1360-00,
connector #6, Pin #1 (TOF terminal) and AF unit X49-1140-00, connector
#6, Pin #4 (TOF terminal)

Or, for individual bands: on RF unit X44-1360-00:

Band Remove (or cut) Part
10 MHz D4
18 MHz D5
24.5 MHz D6

Hi Everyone My name is Jon KG6NXX in California.

ok now i tuned up for 10mtr rite and i was calling out then i was checking out the vox while i was calling cq 10 then i held still the mic gain knob stil, while i was moving the car knob at the same time i was still on vox on 10mtr then it stoped transmitting on me but i was still getting incoming audio then i lost s meter readings on incoming audio signals rite after that so what did i do wrong here and did i blow my tubes on my ts-830s.

thank you .

kg6nxx jon.

I hate to tell you but the Heil Classic IC is for Icom Radios ONLY they require voltage that the Icom Radios supply to the Microphone. The standard Heil Classic would be fine though. If you goto the Heil web page they tell you what works with what Radio
www.heilsound.com
Any of thier mics that do not have the IC folling the Model would work.

Yep, the Heil Classic ICs were made to make up for the fact that earlier ICOMs had one less stage of mic amplification inside the transceiver. It was a nice ploy to make sure everyone bought ICOM microphones with amplifiers built-in. I guess the manufacturer has to make money somehow.....

Motorola did that too, on (for example) the MC Micro range. It let them
get away with ordinary "telephone cord" mike cables, because the audio
comes down them at about 3 volts ;-)

The Classic 4 has the HC-4 cartidge that is mostly used for DX'ing & contesting (adds to the mids and highs in voice) and the classic 5 has the HC-5 cartidge that is for rag-chewing (full range audio). So unless you are into Dx'ing and contests get the Classic 5.

The Classic 4 has the HC-4 cartidge that is mostly used for DX'ing & contesting (adds to the mids and highs in voice) and the classic 5 has the HC-5 cartidge that is for rag-chewing (full range audio). So unless you are into Dx'ing and contests get the Classic 5.

Hello Jon,

First, the "CAR" control has absolutely no control what so ever over the TS-830S RF output in sideband mode. The CAR control functions ONLY in TUNE and CW modes.

There are 3 tubes in the 830, a driver (12BY7) and 2 final amplifiers (6146B or S2001A). The tubes are not used in receive, ONLY in transmit.

Are you asking why the radio switched back to receive quicker than you expected when using VOX or are you asking if you damaged the radio by adjusting the CAR control while transmitting in sideband?

73's
Mike W5RKL

When I brought my Heil headset in 93 at Dayton they threw in a HC-4 and 5, I believe I have the 4 in the boom.
Bringing up this message answered what I had always wanted to know which was better, and this simple answer did that.
It's a shame that both could not be fitted and a mini-switch could be used to switch between the 2.

Anyway I am in the need of some thoughts.
I am looking at buying a boom mic for the radio shack. Have been looking at the GM/GMV with a shock mount. Want it to operate with my TS-830 and TS-480S/AT
What views do those of you that might be running one? The mp3 sample files sound great.

Thanks

Kevin, ZL1KFM.

Aloha Kevin,

They make a Pro Set Plus that has both elements in it it's a little pricey but it is cheaper than buying 2 Pro Set's 4&5. I have 2 prosets one with the 5 and one with the 4 for contesting and DX since Dxing is my most favorite thing in the hobby.

23021. 520S has low power on high (frequency) bands.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-20 14:50:26 UTC
From: larry202br
Topic: 23021 Message: 23021

I've been working this one for some time. someone got in there before me, and destroyed traces and lands, and damaged the switch on the drive coil unit. I tried to repair it, but it was too far gone. I got another drive coil unit, and now it aligns properly, but I have very low power on bands above 14. I have tried four different 12BY7's, to no avail. I can see that the power out of the 12BY7 is low on those bands, looking at the DRV signal with a scope. I'm trying to troubleshoot the input to the driver, so I don't have a good feel for those signal levels yet. I can say that the level at TP3 is good.

Does anyone have any ideas?

23022. RE: [TS-520_820_530_830] 520S has low power on high (frequency) bands.

There are several stages with separate tuned circuits for each band. The driver ouput is one, the transmit mixer is another, along with the heterodyne oscillator. All three circuits have separate "peak-able" tuned circuits. Are they all peaked on the higher bancs? Can you scope the IF and transmitter mixer output comparing the amplitude on lower bands to the higher bands?

23023. TS-520 & TS-520D: differences

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-20 08:41:02 UTC
From: loewensteijn@rocketmail.com
Topic: 23023 Message: 23023

Picked up about a month ago a TS-520 and a week ago a TS-520D. Today the TS-520D arrived. Both rigs are in a sad state.

The D is in a particular bad electric state although cosmetically in a better condition. Someone with no soldering skills (damaging other wires) has been at work (trying?) to apply the QRO mod and blown up the PA and g2 chokes as well as the PA cathode resistors. Finals (Sylvania 6146B) still test OK (8800 Gm and 8300 Gm) but have visible discoloration. Dropping filament voltage shows still plenty of life left in them. Driver tube is marginal.

For those who want to know: I studied the Korean TS-530D with a single tube final and the differences with the "standard" TS-530S. There are some small differences in capacitance used on the low bands and then there is a 6.2 Ohm filament dropping resistor.

I had expected that the TS-520D would similarly to the TS-530D have a single tube but this is not the case. As far as I can determine it looks like it came standard from the factory with two tubes (no sign of a dropping resistor having been removed and the capacitor values in the PA tank are exactly the same as the TS-520. Neither any sign of an addition 15 pF capacitor at the input (g1) having ever been there).

Differences noted: Fixed 100 V mains connection. No switch like 120 /240V (covered up with a small plate). No converter present for running of a battery (plate covering where it needs to go, mains transformer has windings for adding it). Mains transformer a different type than the TS-520 but still has all the same tappings.

The TS-520D is called "Trio" and not "Kenwood". Have been unable to detect any other visible changes, the PC boards all have same numbers in both models.

I like this particular model above later models. Main reason is the PS stage is hard wired rather than a printed circuit board.

Hello Larry,

The TP3 signal is the het xtal osc. This signal is fed to the transmit mixer Q3 where it is mixed with the TIF signal to produce the operating frequency that is then fed to the driver tube's grid. Although the het xtal osc signal does appear at the output of Q3, transmit mixer on the RF UNIT, the het xtal osc signal is rejected by the selected band switch driver tube grid coil on the COIL UNIT, allowing only the operating signal to pass to the grid of the driver tube. L4 and L5 are the suspect coils on the COIL UNIT that may be out of alignment or not making good contact on the band switch wafer S2-2.

I would check the band switch wafers on the COIL UNIT for the higher bands. Another area I would check is the band switch wafers in the FINAL UNIT.

Since the lower bands are working fine then that eliminates the IF UNIT, VFO, CAR UNIT, and FIX CH AVR UNIT as the source of the problem. None of these circuits changes when the band switch setting is changed. The only change that would affect one of these circuits is the MODE switch which changes the CAR UNIT crystals but that would not affect the change the RF output by a change in the band switch setting.

I tried to repair it, but it was too far gone. I got another drive coil unit, and now it aligns properly, but I have very low power on bands above 14. I have tried four different 12BY7's, to no avail. I can see that the power out of the 12BY7 is low on those bands, looking at the DRV signal with a scope. I'm trying to troubleshoot the input to the driver, so I don't have a good feel for those signal levels yet. I can say that the level at TP3 is good.

Hello Marinus,

I can't help on the TS-520D. Don't have the schematic and service manual. If I had the manuals and schematic I would do my best to help.

Discoloration on the inside of the 6146B glass envelopes is not indication of a failing tube.

> The D is in a particular bad electric state although cosmetically in a better condition. Someone with no soldering skills (damaging other wires) has been at work (trying?) to apply the QRO mod and blown up the PA and g2 chokes as well as the PA cathode resistors. Finals (Sylvania 6146B) still test OK (8800 Gm and 8300 Gm) but have visible discoloration. Dropping filament voltage shows still plenty of life left in them. Driver tube is marginal.

Thanks for your reply.

I have peaked all the coils on the drive coil unit, and they do appear to peak properly, just at a lower drive amplitude than that of the lower bands. the original drive coil unit would not do this. It's possible that, even though the drive coil unit is peaking properly, that the low amplitude could be caused by a dirty switch. I will clean it tonight. Since the power is noticeably lower at the DRV signal, which is before the FINAL UNIT switch, wouldn't that mean the problem is before those switch wafer contacts?

Thanks for your reply.

I've peaked the coils following the procedure in the manual. I don't have a sweep gen, so I can't do the BPF adjustment, but I've followed the coil pack adjustment procedure. I will try and scope the IF and mixer outputs with the scope tonight as well.

Yes, that's possible but not any farther back than the transmit mixer. That is why I mentioned to check and clean the driver tube switch wafers S1 and S2.

I believe 830S rf coils use a slug with a sloted head. They look like you could use a plain old screw driver but DON'T. Metal screw drivers could shatter the slug if it is stuck at all. Alignment tool kits have plastic tools with blade type ends. The plastic handle is flexible and will torque slightly if the slug is stuck. You may not move the slug but you certainly won't shatter it. BTW< 830 vintage coils are extremely scarce. I had a broken slug in an 830S about 5-6 years ago and had to find a guy who repairs them who would sell me a 40M coil. Don't break them.
Alignment tool kits are available from Mouser and Antique Electronic Supply in Tempe Az.

Guys-

How embarrassing is this? I told the group that they could cannibalize a YG-455C-1 filter by removing it from its carrier board and be left with a YG-455C solder-in filter.

Well I was wrong.

The YG-455C has a center frequency of 455.7 KHz while the YG-455C-1 has a center frequency of 455.0 KHz. They are not interchangeable. The steep skirt on the YG-455C-1 prevents anything from getting through the 2nd I.F. How do I know? I spent the day trying to figure out why my TS-830S would not work with the YG-455C-1.

Sorry if I caused hardship to anyone.

The other bad news is that the YG-455C is rare as hen's teeth. If you find one latch onto it as it has real value. The Inrad equivalent is $170.

Hi Folks,

After using a TS-520SE for some time I'm now finding my way around a TS-830M that I picked up off Ebay in Italy. Apart from a dry joint in the finals and a dirty band switch it's in very good condition.

I'm following the tune up summary in the manual which ends up with you peaking the RF using the plate and load controls. I get around 110 watts out but if I then go back and check the plate current I'm seeing around 280 mA. Isn't this a tad high?
With my 520 I get max power of 95 watts at around 235 mA plate current and if I increase the load to give a plate current above this figure the power falls off. Bias is set to 60mA on the 830.

Chris SV0XBQ/9

Hi Dick. I had noticed that some of the YKxxxx-1 filters have the same center frequency as the same filter numbers without the -1, and some have a different center frequency. The same is probably true of the YG series' filters. Too bad that they are not all the same filters with the added board to make them plug in instead of solder in.

Guess you will have to find the correct filter, or try one from Inrad. Fortunately, when I bought my TS-130SE, and TS-430S they had the narrow SSB filters installed, and the TS-430 had the AM filter too. If I wasn't in the process of selling my TS-530S, I would be looking for the YK-88Sn for it too.

I don't like to sell it, but I cannot justify (to myself) having three HF rigs (in my financial situation). Plus a friend wants a good HF radio, so I know its going to a good home.

Good luck!

Cleaning the switches didn't help. I do noticed that the signal strength at RF UNIT TP2 is stronger on the weaker bands, no doubt due to the lack of ALC. the signal at TP1 is hard to read, as my 10pf scope probe loads it down, and I don't have a 3 pf RF voltmeter. I suppose it's possible that the new coil pack unit is defective, and is causing the weak transmit, in spite of the fact that it tunes and peaks normally. I'm stuck again, for now anyway.

Hi Chris,

Output will vary with plate current especially if your measurements were on an antenna not a dummy load. Any antenna with more than 1:1 SWR will require different tuning on the plate tank circuit to reach max. output. For reference I have owned 4 830S radios and found the following.

1. Into a dummy load 1:1 SWR@50ohms AND new/good finals I would usually see 100-110W @ around 220-230ma.

2. Into a dummy load with weaker finals I would see the peak output lower (90-95W) at slightly higher plate current.

3. Quality of the HV supply filter caps also affect the max output current. Check the sag on the HV when you tune for maximum output. I didn't see HV lower than ~800V at full output with good finals and new filter caps.

Hope this helps,

Greg
KG6YV

Subject: [TS-520_820_530_830] TS-830M TX Tuning

Hi Folks,

After using a TS-520SE for some time I'm now finding my way around a TS-830M that I picked up off Ebay in Italy. Apart from a dry joint in the finals and a dirty band switch it's in very good condition.

I'm following the tune up summary in the manual which ends up with you peaking the RF using the plate and load controls. I get around 110 watts out but if I then go back and check the plate current I'm seeing around 280 mA. Isn't this a tad high?
With my 520 I get max power of 95 watts at around 235 mA plate current and if I increase the load to give a plate current above this figure the power falls off. Bias is set to 60mA on the 830.

Thanks Greg,
My measurements are taken when I'm using a dummy load. I was a little concerned at the 280 mA plate current but having had time to think about it, when you tune up, the rig is transmitting at 100% duty and that doesn't reflect operational use. I've been on 20m psk this afternoon while keeping the plate current at around 180mA and everything looks fine.

I can take one for you this afternoon if someone doesn't get to it first, mine is the 520SE though so I am not sure if the meters changed between models or not.

Hi Chris,

I would still suspect that 280ma for 110W output on CW indicates either that the finals are not new and/or the HV is sagging a bit more due to age of electrolytics.
I used to get 110W with new finals and caps at around 220-230ma. HV would sag a little from 850V to around 800.

Of course, if your power mains are lower than mine were that could also result in lower HV under load.

Cheers,

Greg

Hi Greg,
HV doesn't seem to sag a lot although someone has replace the HV caps with physically small 450 volt 100 mic ones. I've already ordered new. I've got spare tubes but I'll live with these for now if they can put out 110 watts.

Chris,

I recommend not powering up the 830 until the HV filter capacitors are replaced with capacitors having a voltage rating of at least 500VDC each.

The HV supply in the 830 is a voltage doubling supply. The filter capacitors are wired in series.

You can determine the voltage applied to each capacitor by using the following formula. You will need to know the transformer's HV AC voltage plus the individual capacitor values as well as the total capacitance.

The individual capacitor values are 50ufd each cap.
Total capacitance is 50ufd.

Formula Legend:

TC = "Total Capacitance"

ICV = "Individual Capacitor Value"

ATV = "Applied Transformer Voltage"

VAEC = "Voltage Applied Each Capacitor."

Formula:

TC / ICV x ATV = VAEC

Use the formula "twice", once for each capacitor.

That's my 2 cents worth.

True, I have never seen an 830S with individual 50 uf caps. I think Mike's thinking was right, the typewriter made the mistake. Two 100's in series = 50uf total which is what he typed.

FYI, it's probably OK to use 180's in series which gives you a bit more (90 when put in series). However, I don't subscribe to replacing 100uf caps with say 300uf individual caps which ARE available today in nice sized packaging. The reason is that drastically increasing the capacity in a filter will increase inrush current which the original power transformer was not spec'd to handle. It's a good way to blow power transformers over time. It might power up a few times but eventually that inrush "kick" is likely to cause transformer failure. Besides which the individual bleeders would have to be re-sized if you go too far with an increase of the filter cap size. A case where a bit more is better but a lot more= BOOM/FIZZ/SMOKE eventually.

From: kingtygr
Topic: 23032 Message: 23050

I have to apologize, I cannot get a good picture of the meter. I'm guessing you were thinking of simply printing it out and pasting it onto your existing meter to repair the fading?

I might be able to recreate the meter face another way, but it'd take some time.

Paul

The 50ufd is the total capacitance of "2" 100 ufd caps in "series". I messed up my editing... Sorry about that.

73's

From: sv0xbq
Topic: 23034 Message: 23053

Thanks for your thoughts on this everyone.

I've got a pair of Panasonic 150mic 500volt caps on the way that are the same diameter as the originals so it should look good. Interesting comment on the inrush current. I would have missed that.

Chris SV0XBQ/9

There are automotive gauge repair companies that can restore old dash gauges, they may be able to do the same for you. If you take the meter out, and remove the front cover, you can use some automotive masking tape, like what is used by painters, and mask off the red portion of the meter face then repaint with red paint, or even some fingernail polish.

23055. Scanning Old Kenwood Manuals for Best Quality and yet resonable size

Yahoo group: TS-520_820_530_830 (2009)

What is the best method to scan Manuals to get them so they can be viewed or printed and still have great resolution without making the file size outrageous?
I have adobe Acrobat Pro and a Great HP scanner.
I want to be able to Zoom in on schematics and still have the print be readable.

Thanks,
Gordon

Scan the images at high resolution greyscale, and OCR the printed text.
This takes a while, but it's got the advantage that the text is then
searchable.

I've made some progress on this. Even though I was using a tektronix probe, with 10 M ohm input impedance and 10 pf capacitance, it seems that probe was loading down the signal at the DRV point. I hesitated to tune with the probe, as there was no ALC deflection on the higher bands. I removed the probe and started tweaking the coils, and eventually got some ALC, so things are looking up! I'll move on to turning on the SG tonight, and checking power out.

--- In TS-520_820_530_830@yahoogroups.com, "larry202br" <kc0skx@...> wrote:
>
> Cleaning the switches didn't help. I do noticed that the signal strength at RF UNIT TP2 is stronger on the weaker bands, no doubt due to the lack of ALC. the signal at TP1 is hard to read, as my 10pf scope probe loads it down, and I don't have a 3 pf RF voltmeter. I suppose it's possible that the new coil pack unit is defective, and is causing the weak transmit, in spite of the fact that it tunes and peaks normally. I'm stuck again, for now anyway.
> >
> > --- In TS-520_820_530_830@yahoogroups.com, "larry202br" <kc0skx@> wrote:
> > >
> > > I've been working this one for some time. someone got in there before me, and destroyed traces and lands, and damaged the switch on the drive coil unit. I tried to repair it, but it was too far gone. I got another drive coil unit, and now it aligns properly, but I have very low power on bands above 14. I have tried four different 12BY7's, to no avail. I can see that the power out of the 12BY7 is low on those bands, looking at the DRV signal with a scope. I'm trying to troubleshoot the input to the driver, so I don't have a good feel for those signal levels yet. I can say that the level at TP3 is good.

Hi Gordon,
Resize the images at 72 dpi. This will reduce the size of the files and
still leave them readable.

Chris

Thanks Chris,
but what resolution do you suggest I do the originals at?
I am thinking maybe 300 or 600 dpi and then resize down to 72, but will
it still be readable when I zoom in on the Schematics this way?

23060. Re: [TS-520_820_530_830] Scanning Old Kenwood Manuals for Best Quality and yet resonable size

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-22 19:55:01 UTC
From: Jon
Topic: 23055 Message: 23060

For the schematics I suggest a good digital camera and a macro lens and
save as a jpeg....1.2MB file size at 6 MPixals or better should be quite
detailed.

Some of the older DSLR's would be perfect for this....

73,
Jon

23061. Re: [TS-520_820_530_830] Scanning Old Kenwood Manuals for Best Quality and yet resonable size

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-22 23:17:09 UTC
From: pmarkavage
Topic: 23055 Message: 23061

Scan the originals using gray scale with a resolution no more then 100 to
150 dpi. Scanning at a higher resolution, 300, 600, or 1200 and then
resizing back down doesn't really buy you much. Don't scan in true color,
256 color, etc. If you scan at too high of a resolution, you start
scanning the texture of the paper that has the printed text or drawings.
The majority of all papers are not "true" white and with age, the paper
also tends to discolor. Also, if the paper is thin, and you scan a high
resolution, you may also scan the backside of the paper where there may
be areas with lots of print or photos, and it will either bleed through
and/or cause shadows to the side you really want to scan.

Thanks Pete,
I will give that a try.
What about the Schematics that have Circuits shown in Red or Voltages
shown in red? Shouldn't they be in Color?

I tried to find it. But I had a link to software that had reproductions of meter faces and or draw your own. Dang if I can not find it.

Subject: [TS-520_820_530_830] Re: Meter TS-520

I have to apologize, I cannot get a good picture of the meter. I'm guessing you were thinking of simply printing it out and pasting it onto your existing meter to repair the fading?

I might be able to recreate the meter face another way, but it'd take some time.

Lou,
Tried the link and its not opening the page for some reason. Thought this would be neat to have if I needed to do a meter face myself.

NP Don,

I tried the link in my subsequent post and it does work. Be aware
that you don't get a webpage just a blank screen. After a few moments
a little download window opens. The other problem you might have is
your IE may be blocking the download window.

From: w5rkl
Topic: 23032 Message: 23069

I tried it as well and it works fine. It's an "FTP" site which downloads the file in zip format.

I use Firefox, not IE.

If you are using IE you might try right clicking the link and select "Save Target As".

23070. Re: [TS-520_820_530_830] Re: Meter TS-520

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-23 02:01:10 UTC
From: Don Thomas
Topic: 23032 Message: 23070

I found the site and still not working. Think its the wireless network I'm on at the moment blocking it. Should work when I get on a real network later.

I tried it as well and it works fine. It's an "FTP" site which downloads the file in zip format.

I use Firefox, not IE.

If you are using IE you might try right clicking the link and select "Save Target As".

23071. Re: [TS-520_820_530_830] Scanning Old Kenwood Manuals for Best Quality and yet resonable size

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-23 03:57:02 UTC
From: Chris and Alex
Topic: 23055 Message: 23071

Hi Gordon,
If you scan at 300 dpi that will give you more than enough detail. Then
resize to 72dpi and zoom in to see if you've got the quality that you want.
If you want more detail increase the dpi a little. If you scan in black and
white or convert to black and white this will keep your file size down as
well.

23072. Re: [TS-520_820_530_830] Scanning Old Kenwood Manuals for Best Quality and yet resonable size

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-23 07:42:12 UTC
From: pmarkavage
Topic: 23055 Message: 23072

The problem boils down to how big do you want the file to get. I seriously doubt most people would care if the voltages appear in red, blue, green, or shades of gray. Gray scale provides shading without the high overhead of bytes. Likewise for any colored lines. If you scan a sheet(s) in true color or 256 color, you not only have to consider the lines you're scanning but also the color and texture of the paper that it's printed on. Very few manual sheets are ever printed on true white paper. Most are white-blue or white-gray, egg shell, or some variation of white. Paper surfaces can be matte, opaque, semigloss, or gloss. Paper age ,and years of environment, then tweak the paper color to be even less white.

I've seen schematics where the voltages were in color for TX and RX if they were different. Also have seen where the red didn't show up when scanned as a black and white or grey scale item.

Hi Guys. If I had this problem, I would probably scan the meter scale on my old flatbed scanner. Then I would have a file that I could touch up in pretty much any image editing software (even MS paint will work). Then I could print out a replacement. Printing on ordinary printer paper or maybe a transparency sheet should work fine.

Just my thoughts...

Hi Gordon. I would not scan at less than 300DPI. I have had good
luck using 600DPI, and increasing jpeg compression. Your results may
vary depending the quality of the manual, and the particular scanner.
I find that scanning in color usually results in very large files.
I scan in line-art mode. You will have to experiment to see what
works best with your equipment.

Just my thoughts.

Does your software have a 16 color mode? This would still preserve the basic colors, but reduce the file size to something managable. Just a thought !

Good luck, Jim

Of course, the assumption from the generator of the schematics was that everyone who used the schematic could distinguish specific colors, which is not always true. I've also seen many times when "red" is used on the drawings, it isn't always red. Sometimes it appears as red-orange or even orange. It also appears on some drawings (several electronic manufacturers are known for this) as a lighter shade of red or red-orange. Poor quality scanners, and ones that dub as multi-function machines (scan/fax/copy/print) always seem to have trouble scanning a document when lighter shades, including color, are intermixed with black/white printing. Blue, and variations of blue, color can also be problematic when trying to scan a drawing when the majority of the print is black.

I am using the HP 4C flatbed scanner.
I wish I had better software for it since the Deskscan software it came
with is years outdated.
It has no trouble seeing any colors that I have ever found.

I remember using the 4C back in the days of Windows 3.1 and 95. Haven't
used one in years.

I have a TS520 I am parting out. It has good meter that is not faded out. Would ask a resonable offer plus $5.00 for shipping if that would help any. Let me know. Eldon w0szv

That or it's just a slow network. I downloaded it yesterday just fine, but it takes a while and it acts like it's not doing anyhting for a while till the download really starts.

I tried it too, but found the following

the link http://tinyurl. com/35qg5l should be without the space between the dot and com
http://tinyurl.com/35qg5l like that.

Dave

After getting home yesterday, downloaded it with no problem. Guess the firewall on the wireless network I was connecting thru was blocking the URL. Thanks

Don T.

I just got myself a 520s in great cons along with a vintage Swan 100 mxa a kenwood 261a 2 meter and a magnum 257 10 meter and a cobra 142gtl just the begining of my shack hope to pick all of your brains on the 520s thanks again KB1NZQ Karl

23087. TS-820S T/R Relay

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-25 22:29:26 UTC
From: km5rv
Topic: 23087 Message: 23087

I have a problem where I can transmit, but when I let off the key the radio will not go back to the receive mode immediately. I have checked the mike, and it is not there. I am guessing it is in a relay in the radio. (vox is not on) Is this something that can be cleaned easily, and where might I start looking for this relay? Any help would be appreciated. By the way this is an intermittent problem.

23088. TS-830 Stopped Transmitting

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-26 00:02:58 UTC
From: f_canuso
Topic: 23088 Message: 23088

Today, I was on 17 meter fone when all of a sudden, as I was signing with the other station, there was a loud pop from the final cage and an orange flash. The radio stopped transmitting. I turned the radio off and took the covers off and looked inside the final cage to see if there was any visible damage. I could not see any damaged components. I removed the final tubes and lifted the final board to more closely inspect the resistors, etc. and could find no visible damage. I put everything back together and turned on the power and heater switches and let the tubes warm up. I then set the mode switch to usb and the carrier control to 0. When I turned on the send switch with the meter in the IP position to look for bias, the meter immediately pinned all the way to the right. The HV shows about 850 volts. I then turned the rig off.

Does anyone have an idea as to what happened and where I should go from here?

I suspect one or both final tubes are shorted. The flash was more than likely an arc inside one or both final tubes.

I also recommend checking all 4 of the cathode resistors, R2 thru R5, on the bottom of the final unit. If any of them appear to be charred, cracked, or otherwise discolored, replace all 4 of them. Each resistor is 20 ohms at 1/2 watt.

> I then set the mode switch to usb and the carrier control to 0.

The "CAR" control has absolutely no control what so ever over the RF output in sideband mode (USB or LSB). The CAR control is active ONLY in TUNE, CW-W, or CW-N modes.

IF, as I stated above, one or both of the final tubes are shorted, then that would account for the full scale IP meter reading as you have stated. Check both tubes with a tube tester.

There are 2 relays in the TS-820. One that controls the 820's receive and transmit functions and the other is the antenna change over and linear amplifier control relay.

To access the relays, remove both top and bottom covers. Turn the 820 upside down, front panel facing you. Looking in the middle of the chassis you will see a relay in a relay socket on a small PC board. This is the relay that controls transmit and receive functions.

Looked at the bottom left rear you will see the final unit PC board. Between the rear of the final unit PC board and the rear panel you will see a small metal enclosure. That is the antenna change over and linear amplifier control relay. You will have to remove the small metal enclosure to gain access to the antenna change over and linear amplifier control relay. The relay in the middle can be removed by pulling gently upwards. Both relays sit in plug in sockets. Both relays are the same. The problem you are talking about appears to be the antenna change over and linear amplifier control relay, it's contacts are covered in carbon. The original relays are no longer available. Check the "Files" section of this forum for replacement sources.

To clean the relays, gently pry the plastic covers off. Using a piece of paper soaked with contact cleaner, slide the paper between the relay contacts until the paper no longer turns black. Use caution when cleaning the relay contacts to prevent bending or damaging the relay contacts in any way. Use canned air to remove excessive contact cleaner.

Carbon build up on relay contacts can affect the circuits the relay controls.

I just wanted to let anyone know if you plan on pulling the rigs Chassie face off, Your in for a real job !! I pulled it so I could replace all the lamps and also remove the whole VFO for a cleaning and lubing and do some good cleaning in the front of the rig..

The toughest parts to work with are the 5 switches, Sometimes they even fall apart and you have some very small parts to try and put back together. They mount in the face of the radio and are so hard to remov e and put back in, And of coarse the very short mic connector wires on the back of the microphone connector in the face. Its to bad that kenwood could not of left them a little longer.

Not to worry as I am not complaining too much and I still love this rig but it almost been more work then I ever thought it would be to restore.

I hope it works on the air as good as it is starting too look now.
